#### Abstract

Three new $\mathrm{C}_{19}$-diterpenoid alkaloids, named aconitramines $\mathrm{A}(\mathbf{1}), \mathrm{B}(\mathbf{2})$, and $\mathrm{C}(\mathbf{3})$, were isolated from Aconitum transsectum. By UV, IR, 1D- and 2D-NMR, and MS analyses, their structures were elucidated as 18 -methoxyvilmoraconitine, 18 -demethoxydolichotine A , and 18-demethoxydolichotine B . Compound $\mathbf{1}$ is the second known $\mathrm{C}_{19}$-diterpenoid alkaloid with a three-membered ring formed by $\mathrm{C}(8)$, $C(9)$, and $C(10)$.

Introduction. - Aconitum transsectum Diels (Ranunculaceae), a perennial herb distributed in the north-west of Yunnan Province in China, has long been used as a folk medicine to treat rheumatism and pains [1]. Previous phytochemical investigations on this plant revealed that $\mathrm{C}_{19}$-diterpenoid alkaloids were the main constituents [2-4]. Pharmacological studies demonstrated that the diterpenoid alkaloids were the effective components in the Aconitum genus [5]. To find more biologically active substances, the roots of $A$. transsectum were phytochemically investigated to afford three new $\mathrm{C}_{19}{ }^{-}$ diterpenoid alkaloids, named aconitramines A (1), B (2), and C (3) (Fig. 1). This article reports the isolation and structure elucidation of the three new alkaloids.

Fig. 1. Stuctures of compounds $\mathbf{1}-\mathbf{3}$, isolated from Aconitum transsectum

Results and Discussion. - Aconitramine A (1) was obtained as a colorless gum and assigned the molecular formula $\mathrm{C}_{24} \mathrm{H}_{35} \mathrm{NO}_{4}$ by analyses of its EI-MS $\left(\mathrm{m} / \mathrm{z} 401\left(M^{+}\right)\right)$ and HR-EI-MS $\left(m / z 402.2638\left([M+\mathrm{H}]^{+}\right)\right.$. The IR spectrum showed the absorption band for a $\mathrm{C}=\mathrm{O}$ group ( $1730 \mathrm{~cm}^{-1}$ ). The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum (Table) displayed one N ethyl $\left(\delta(\mathrm{H}) 1.03\left(t, J=7.2 \mathrm{~Hz}, \mathrm{MeCH}_{2} \mathrm{~N}\right)\right.$ ) and three MeO groups $(\delta(\mathrm{H}) 3.25,3.27$, and 3.35 (3s)), and the ${ }^{13} \mathrm{C}$-NMR (DEPT) displayed 24 C -atom signals (Table) including signals for four Me groups, eight $\mathrm{CH}_{2}$ groups, seven CH groups, and five quaternary Catoms. The above spectral data suggested that compound 1 might be an aconitine type $\mathrm{C}_{19}$-diterpenoid alkaloid [6][7]. Comparing the ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}$-NMR spectral data (Table) of compound 1 with those of vilmoraconitine $(=(1 \alpha, 16 \beta)$-20-ethyl-1,16-dimethoxy-4-methyl-8,10-cycloaconitan-14-one) [8] showed great similarity, except for the signals of an additional MeO group $\left(\delta(\mathrm{H}) 3.27(s, \mathrm{MeO}-\mathrm{C}(18) ; \delta(\mathrm{C}) 59.4(q))\right.$ and of a $\mathrm{CH}_{2}$ group $\left(\delta(\mathrm{H}) 2.97\right.$ and $3.08\left(2 d\right.$, each $\left.\left.J=8.8 \mathrm{~Hz}, \mathrm{CH}_{2}(18)\right) ; \delta(\mathrm{C}) 79.4(t)\right)$ in compound $\mathbf{1}$. This $\mathrm{CH}_{2}(18)$ signal of $\mathbf{1}$, which was shifted downfield to $\delta(\mathrm{C}) 79.4(t)$ from $\delta(\mathrm{C}) 26.2(q$, $\mathrm{Me}(18)$ ) in vilmoraconitine, suggested that there was only one MeO group located at $\mathrm{C}(18)$. This was confirmed by the HMBC cross-peaks between $\mathrm{CH}_{2}(18)(\delta(\mathrm{H}) 2.97$ and 3.08) and $\mathrm{C}(3)(\delta(\mathrm{C}) 32.8(t), \mathrm{C}(4)(\delta(\mathrm{C}) 39.2(s)), \mathrm{C}(5)(\delta(\mathrm{C}) 44.0(d)), \mathrm{C}(19)(\delta(\mathrm{C})$ $53.2(t))$, and $\mathrm{MeO}-\mathrm{C}(18)(\delta(\mathrm{C}) 59.4(q))$ (Fig. 2). The 2D-NMR spectra including HMQC, HMBC, COSY, and ROESY data resulted in the assignments of all the H - and C -atoms of compound $\mathbf{1}$ (Table). Compound $\mathbf{1}$ had the same relative configuration as ajabicine $(=(1 \alpha)$-20-ethyl-4-methyl-14-methyleneaconitan-1,8-diol) [9], being supported not only by their almost identical ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}$-NMR data (Table) but also by the ROESY data (Fig. 3). Thus, the structure of compound $\mathbf{1}$ was determined as 18methoxyvilmoraconitine, named aconitramine A (1).

[^0]Aconitramine B (2) was obtained as a colorless gum and reacted positively to the Dragendorff reagent. It was deduced to have a molecular formula $\mathrm{C}_{33} \mathrm{H}_{45} \mathrm{NO}_{7}$ based on its ESI-MS $\left(m / z 568\left([M+H]^{+}\right)\right)$and HR-ESI-MS $\left(m / z 568.3291\left([M+\mathrm{H}]^{+}\right)\right)$. The IR spectrum showed the absorptions for a conjugated ester $\mathrm{C}=\mathrm{O}\left(1738 \mathrm{~cm}^{-1}\right)$ and an aromatic ring ( 1607,1511 , and $1463 \mathrm{~cm}^{-1}$ ). The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ data (Table) displayed the presence of an $N$-ethyl group ( $\delta(\mathrm{H}) 1.07\left(t, J=7.1 \mathrm{~Hz}, M e \mathrm{CH}_{2} \mathrm{~N}\right)$ ), two MeO groups $(\delta(\mathrm{H}) 3.28$ and $3.32(2 s))$, a quaternary Me group $(\delta(\mathrm{H}) 0.70(s, \mathrm{Me}(18))$, and an Ac $(\delta(\mathrm{H}) 1.78(s))$ and anisoyl (=4-methoxybenzoyl; As) group ( $\delta(\mathrm{H}) 7.92$ and $6.90(2 d$, each $J=8.8 \mathrm{~Hz}$ ) and $3.85(s))$. Careful analyses of the NMR spectra suggested that compound 2 was also an aconitine type $\mathrm{C}_{19}$-diterpenoid alkaloid. The ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}$-NMR spectra (Table) of $\mathbf{2}$ were identical to those of dolichotine A $(=(1 \alpha, 14 \alpha, 16 \beta)$-20-ethyl-1,16-dimethoxy-4-(methoxymethyl)aconitane-8,11-diol 14-acetate 8-(4-methoxybenzoate)) [10], except for one more quaternary Me group ( $\delta(\mathrm{H}) 0.70(s) ; \delta(\mathrm{C}) 26.3)$ in 2, instead of the the $\mathrm{CH}_{2}(18)$ bearing an MeO group in dolichotine A . The additional quaternary Me group was located at $\mathrm{C}(4)$, based on the long-range correlations between $\mathrm{Me}(18)(\delta(\mathrm{H}) 0.70)$ and $\mathrm{C}(3)(\delta(\mathrm{C}) 37.8(t)), \mathrm{C}(4)(\delta(\mathrm{C}) 34.4(s)), \mathrm{C}(5)(\delta(\mathrm{C})$ $45.1(d))$, and $\mathrm{C}(19)(\delta(\mathrm{C}) 56.6(t))$ in the HMBC spectrum (Fig. 2). Accordingly, compound 2 was established to be 18-demethoxydolichotine A (Fig. 1).

Aconitramine C (3) had a molecular formula $\mathrm{C}_{34} \mathrm{H}_{47} \mathrm{NO}_{8}$, in agreement with the ESI-MS ( $\mathrm{m} / \mathrm{z} 598\left([M+\mathrm{H}]^{+}\right)$) and positive-ion mode HR-ESI-MS ( $\mathrm{m} / \mathrm{z} 598.3373$ $\left([M+\mathrm{H}]^{+}\right)$. The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ data (Table) showed the presence of an $N$-ethyl group, a quaternary Me, an Ac, and a veratroyl (=3,4-dimethoxybenzoyl; Vr) group, which exhibited characteristic features of an aconitine-type $\mathrm{C}_{19}$-diterpenoid alkaloid bearing an $N$-ethyl group. The 1D-NMR spectra (Table) of $\mathbf{3}$ resembled those of dolichotine B [10] except for the presence of one more quaternary Me group ( $\delta(\mathrm{C}) 26.3$ ) in $\mathbf{1}$ at $\mathrm{C}(4)$, instead of the $\mathrm{CH}_{2}(18)$ bearing an MeO group in dolichotine B . The quaternary Me group was attached at $\mathrm{C}(4)$, as suggested by the HMBC cross-peaks between $\delta(\mathrm{H}) 0.69$ ( $s, \mathrm{Me}(18)$ ) and $\mathrm{C}(3), \mathrm{C}(4), \mathrm{C}(5)$, and $\mathrm{C}(19)$. Hence, compound $\mathbf{3}$ was defined as 18demethoxydolichotine B (3).

As far as we know, vilmoraconitine [8] is the only known $\mathrm{C}_{19}$-diterpenoid alkaloid with a three-membered ring formed by $\mathrm{C}(8), \mathrm{C}(9)$, and $\mathrm{C}(10)$. Compound $\mathbf{1}$ is thus the second $\mathrm{C}_{19}$-diterpenoid alkaloid with this three-membered ring isolated from a natural source, providing a new candidate for further pharmacological investigations.

The authors are grateful to the staff of the analytical group of the State Key Laboratory of Phytochemistry and Plant Resources in West China, Kunming Institute of Botany, Chinese Academy of Sciences, for the measurements of all spectra.

## Experimental Part

General. Column chromatography (CC): silica gel ( $\mathrm{SiO}_{2}, 200-300$ mesh; Qingdao Meigao Chemical Ltd., Qingdao, P. R. China), $\mathrm{Al}_{2} \mathrm{O}_{3}$ (Shanghai Wusi Chemical Reagents Co., Ltd.), and Sephadex LH-20 (Pharmacia Fine Chemical Co., Ltd., Germany). M.p.: XRC-1 micro melting point apparatus; uncorrected. Optical rotations: Horiba SEPA-300 polarimeter. UV Spectra: Shimadzu-UV-2401A spectrophotometer; $\lambda_{\max }(\log \varepsilon)$ in nm. IR Spectra: Bio-Rad-FTS-135 spectrometer; $\tilde{v}$ in $\mathrm{cm}^{-1}$. 1D- and 2D-NMR Spectra: Bruker- $A M-400$ and -DRX-500 spectrometers; $\delta$ in ppm with reference to the solvent signals, $J$ in Hz. MS: VG-Autospec-3000 spectrometer; at 70 eV ; in $m / z$. HR-ESI-MS: API Qstar-Pulsar-1 spectrometer; in $m / z$.

Plant Material. The roots of Aconitum transsectum Diels. were collected in Dali of Yunnan Province, P. R. China, in October 2010, and authenticated by Prof. Dr. Li-Gong Lei at the Kunming Institute of Botany. A voucher specimen (No. KIB 2010-10-12) has been deposited with the Group of Anti-Virus and Natural Medicinal Chemistry, Kunming Institute of Botany, Chinese Academy of Sciences.

Extraction and Isolation. The roots of A. transsectum ( $10 \mathrm{~kg} \mathrm{)} \mathrm{were} \mathrm{powdered} \mathrm{and} \mathrm{extracted} \mathrm{three}$ times with $90 \% \mathrm{EtOH}$ under reflux for 2 h . After evaporation of the solvent, the crude extract was dissolved with $2 \% \mathrm{HCl}$ soln. (41), and then filtrated. The acidic soln. was basified to pH 9.0 with $\mathrm{NH}_{3}$. $\mathrm{H}_{2} \mathrm{O}(25 \%)$ and extracted with $\mathrm{CHCl}_{3}$ to obtain the crude alkaloid extract ( 115 g ) after evaporation of $\mathrm{CHCl}_{3}$. The extract was subjected to $\mathrm{CC}\left(\mathrm{SiO}_{2}(800 \mathrm{~g})\right.$, petroleum ether/acetone/ $\mathrm{Et}_{2} \mathrm{NH} 40: 1: 1 \rightarrow$ $15: 8: 1)$ : Fractions $A-D$. Fr. B $(6.2 \mathrm{~g})$ was subjected to $\mathrm{CC}\left(\mathrm{SiO}_{2}\right.$, petroleum ether/acetone $/ \mathrm{Et}_{2} \mathrm{NH}$ $35: 1: 1)$, followed by $\mathrm{CC}\left(\mathrm{Al}_{2} \mathrm{O}_{3}\right.$, petroleum ether/acetone $\left.13: 1\right)$ and finally purified by CC (Sephadex LH-20, $\left.\mathrm{CHCl}_{3} / \mathrm{MeOH} 1: 1\right): \mathbf{1}(8.2 \mathrm{mg}), \mathbf{2}(20 \mathrm{mg})$, and $\mathbf{3}(16 \mathrm{mg})$. Fr. C $(28.5 \mathrm{~g})$ was subjected to CC $\left(\mathrm{SiO}_{2}\right.$, petroleum ether/acetone/ $\left.\mathrm{Et}_{2} \mathrm{NH} 20: 3: 1\right)$ and further purified by $\mathrm{CC}\left(\mathrm{Al}_{2} \mathrm{O}_{3}\right.$, petroleum ether/ acetone $8: 1$ ): $\mathbf{3}(24 \mathrm{mg})$.

Aconitramine $A(=18-M e t h o x y v i l m o r a c o n i t i n e ~=(1 \alpha, 16 \beta)-20 E t h y l-1,16$-dimethoxy-4-(methoxy-methyl)-8,10-cycloaconitan-14-one; 1).
