摘要：欣逢邓公叔群院士、教授百年华诞，感其一生更劳心曲，菌学开拓，景星庆云，近在福建武夷山发现牛肝菌科一新种：叔群华牛肝菌 *Sinoboletus tengii* Zang et Liu, sp. nov., 谨以此名，敬寄慕念。

A New Bolete, *Sinoboletus tengii* from ChinaZANG Mu¹, LIU Yan²(1 *Cryptogamiae Herbarium Kunming Institute of Botany, Chinese Academy of Sciences, Kunming, 650204, China;*2 *School of Life Science, Xiamen University, Xiamen, 361005, China*)

Abstract: A new boleteous fungus *Sinoboletus tengii* is described from Prov. Fujian, China. In honor of a distinguished Chinese foremost Mycologist, the late academican of Chinese Academy of Sciences Teng Shu Chun (December 12, 1902 - May 10, 1970), the authors named the species "tengii".

Key words: *Sinoboletus tengii*; New species

Sinoboletus tengii M. Zang et Y. Liu, sp. nova (Fig. II: 1 - 6)

Holotypus: China, Fujian. Wu Yi Mts (武夷山), Huang Gang San (黄岗山), Shan Gang (三港), Tong Mu (桐木), 740 - 1 740 m, alt. Under *Lithocarpus harlandii* Rehd. (东南石栎), *Lithocarpus hancei* (Berk.) Rehd (硬叶石栎) & *Tsuga tchekiensis* Flous (南方铁杉) forests, 10 VIII 2001. Y. Liu 10626005 (HKAS 38754 Typus).

Pileus 3 - 5 cm latus, laevigatus, primum convexus, gelatinus deinde planus siccus, rubicundus, rubineus vel roseolus. **Contextus** 0.5 - 1 cm crassus, flavus, usque flavidus, exposito caerulescens. **Hymenium** ut in Boletis, clare flavum vel aureum, decurrens. **Tubis bistratis adnatis instructum**, tubis superioribus 0.1 - 0.3 mm longis, 0.1 - 0.2 mm crassis tramis paralleloneuris, inferioribus 2 - 4 mm longis, 0.1 - 0.3 mm crassis, tramis atriatibus poris angularibus vel irregularibus 10 - 12 per cm praeditis. **Stipes** 5 - 6.5 × 0.5 - 1.2 cm, clavatus, haud reticulatus, apice rubidus

作者简介：臧穆 (1931 -) 男，研究员，主要从事菌物学研究。

striatus, basim versus bulbosus, albidus, Basidiosporae $10 - 12 \times 5 - 5.6 \mu\text{m}$, ellipsoideae, leavis, flavo-hyalinae. Basidia obclavata, $20 - 30 \times 10 - 15 \mu\text{m}$. Pleurocystidia clavata, $20 - 40 \times 8 - 15 \mu\text{m}$. Cheilocystidia fusiformia $30 - 45 \times 8 - 12 \mu\text{m}$. Tramae tubi superiori paralleloneurae tubi interiori striae.

Habitat: Under *Lithocarpus hancei* (Benth.) Rehd., *L. harlandii* Rehd and *Tsuga tchekiangensis* Flous.

Pileus 3 - 5 cm broad, convex when young, expanding to plane, surface gelatinized when young, dry when mature, smooth, ruddy, rubyred, pale rose. Context 0.6 - 1 cm thick, yellow to pale yellow, changing blue on exposure. Hymenophora bright yellow to golden yellow, adnate to sinuate-adnate, decurrent, boletinoid and compound, tubes with crass-veins produced in two definite layers; superior tubes 0.1 - 0.3 mm long, 0.1 - 0.2 mm diam., interior tubes 2 - 4 mm long, 0.1 - 0.3 mm diam., 10 - 12 pores /per cm. Stipes 5 - 6.5 \times 0.5 - 1.2 cm, clavate to equal, ruby red apically, not reticulate but striate, base bulbous, whitish. Basidiospores $10 - 12 \times 5 - 5.6 \mu\text{m}$, ellipsoid, smooth, hyaline to pale yellow microscopically. Basidia obclavate $20 - 30 \times 10 - 15 \mu\text{m}$. Pleurocystidia clavate, $20 - 40 \times 8 - 15 \mu\text{m}$. Cheilocystidia fusiform, $30 - 45 \times 8 - 20 \mu\text{m}$. Upper tube trama provided with parallel veins, lower tube trama striated.

Additional specimens examined: Fujian Prov. Wu Yi Mts (武夷山), 黄岗山 (Huang Gang San), San Gang (三港), Tong Mu (桐木), 1 200 m alt. under *Lithocarpus harlandii* Rehd. And *Tsuga tchekiangensis* Flous forests. 10 VIII 2001. Y. Liu 10866009, (HKAS 38756 Holotypus!).

Etymology : Tengii = in honor of Mycologist Prof. S. C. Teng

Commentary : *Sinoboletus tengii* is characterized by the reddish pileus, stipe and jelly-like pileus surface when young, the basidiospores are smaller than those of *Sinoboletus maekawae* Zang et Petersen, the pleurocystidia and cheilocystidia are more narrowly.

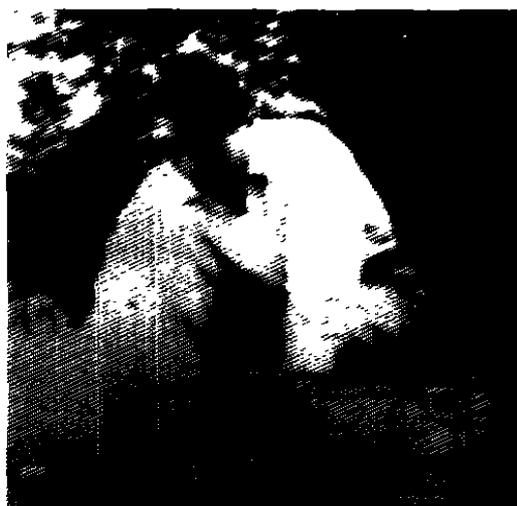

Acknowledgements: The senior author appreciate a loan of Prof. Teng's photographs from his family archives. This research was supported in part by grant 3989400 from the National Natural Science Foundation of China and to Prof. Z. Y Su (Kunming Institute of Botany) for the Latin diagnosis.
