(Received 25th November, revised 19th September, 1991)

Summary: Reactions of 4-hydroxycoumarin(1) with aldehydes under Knoevenagel conditions initially form intermediates (3) which subsequently react with additional quantity of (1) or thiophenol to yield biscoumarins (2) or (benzo-4-hydroxy-2-oxo-2H-pyran-3-yl) (aryl) phenylthiomethane (4a,b,c) in excellent yields.

Introduction

Electrophilic substitution reactions of 4-hydroxycoumarin (1) at the 3-positions are well known [1-7]. However, reactions with aldehydes have been only scarcely reported [8,9].

During the course of our synthetic investigations we have found that the reactions of 4-hydroxycoumarin(1) with aldehyde under Knoevenagel conditions using piperidine and acetic acid in ethanol give excellent yields of biscoumarins (2). The results obtained are summarized in the Table. The reaction involves the initial formation of an highly reactive electrophilic species (3) via aldol condensation in the presence of piperidinium acetate [10] formed in the reaction mixture which subsequently condenses with additional quantity of 4-hydroxycoumarin(1) through Michael type reaction to form biscoumarin (2).

Attempts to stop the reaction at the product (3) and to isolate it were unsuccessful. However, the trapping of the intermediate (3) with thiophenol to form 3-substituted coumarins of type (4) was considered feasible. As anticipated the reactions of 4-hydroxycoumarin (1) with benzaldehyde or 2-nitrobenzaldehyde or 2-chlorobenzaldehyde and thiophenol (molar ratio 1:1:2) under Knoevenagel conditions afforded the products (4a,b,c) in good yields. These reactions provide a simple and convenient method not only for the synthesis of biscoumarins (2) but also for 3-substituted-4-hydroxycoumarins (4) which are of synthetic importance and possess physiological properties [11-13].

Experimental

4-Hydroxycoumarin (Fluka) m.p. 211-213°C and aldehydes used were of technical grade, purified where necessary.

Infrared spectra were recorded on JASCO-IRA-1 spectrophotometer in Nujol. ¹H-NMR spectra were recorded on R-24B, 60-MH spectrometer (Hitachi) using tetramethyl silane as internal reference and are quoted in ppm (δ). Melting points were recorded on Gallenkamp melting point apparatus.

General procedure for the preparation of biscoumarin(2)

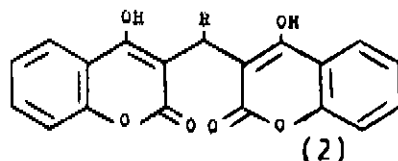

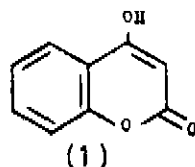

A solution of 4-hydroxycoumarin (1, 0.02 mol) in dry ethanol (15 ml) was gradually added to a solution of appropriate aldehyde (0.01 mol), acetic acid (0.5 ml) and piperidine (0.5 ml) in ethanol (15 ml). The reaction mixture was refluxed which on cooling gave solid product. The products were crystallized from ethanol-chloroform mixture. The reaction conditions, spectral data and analytical data are given in Table 1

(Benzo-4-hydroxy-2-oxo-2H-pyran-3-yl)phenylthiomethane (4a)

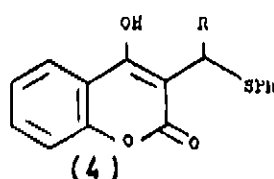

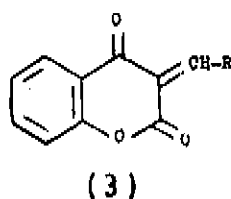

4-Hydroxycoumarin (1, 0.05 mol) in dry ethanol (20 ml) was added to a stirred solution of benzaldehyde (0.01 mol), thiophenol (0.02 mol), acetic acid (0.5 ml) and piperidine (0.5 ml) in ethanol (15 ml). The reaction mixture was vigorously stirred at ambient temperature for 6 hours. The

solid product was filtered out and washed with hexane-ethylacetate mixture (20:1) to remove unreacted thiophenol. Crystallisation from chloroform gave solid (80%) m.p. 157-158°C; ν_{\max} . 1680, 1660 (CO), 1600 (-C=C-); ¹H-NMR: (d₆DMSO) δ 5.8 (s, 1H), 6.9-7.7 (m, 14H-aromatic) 9.5 (broad, 1H of -OH); calc for C₂₂H₁₆SO₃; C, 73.33; H, 4.44; S, 8.88. Found; C, 73.50, H, 4.60, S, 8.65.

The following compounds (4b, 4c) were prepared by the similar method.

Benzo-4-hydroxy-2-oxo-2H-pyran-3-yl (2-nitrophenyl) (phenyl-thiomethane) (4b)

This compound was prepared in 85% yield by stirring the reaction mixture for 8 hours at room temperature. Crystallization from chloroform-ethanol gave solid m.p. 161-162°C; ν_{\max} . 1680 (CO); 1600 (-C=C-); ¹H-NMR (d₆, DMSO); δ 5.8 (s, 1H); 7-7.5 (m, 13H aromatic), 9.8 (broad, 1H of -OH); calcd for C₂₂H₁₅NO₅; C, 65.18; H, 3.70; S, 7.90; N, 3.45; Found C, 65.35; H, 3.6; S, 8.00; N, 3.35.

Benzo-4-hydroxy-2-oxo-2H-pyran-3-yl (2-chlorophenyl)phenyl-thiomethan (4c)

This compound was obtained in 70% yield by stirring the reaction mixture at room temperature for 6 hours. Crystallization from chloroform-ethanol mixture afforded white solid m.p. 180-182°C. ν_{\max} . 1680 (CO), 1610 (-C=C-); ¹H-NMR (d₆, DMSO): δ 5.9 (s, 1H), 7.1-7.5 (m, 13H aromatic), 8.5 (broad, 1H, of -OH); calcd. for C₂₂H₁₅SClO₃; C, 66.92; H, 3.80; S, 8.11; Cl, 8.99. Found: C 66.65; H, 3.6; S, 8.4; Cl, 8.85.

(Received 13th March, 1991, revised 22nd October, 1991)

Summary: Hetero ring opening of the 3,2-benzoxazinone derivative 1 by different nitrogen nucleophiles, namely, hydrazine hydrate, aniline, p-anisidine and anthranilic acid has been investigated. Also the behaviour of 3,2-benzoxazinone 1 towards carbon nucleophiles like aromatic hydrocarbons under Friedel Craft's conditions and alkyl halides under Grignard reaction conditions has been studied.

Introduction

It is well known [1] that 2-substituted-(4H)-3,1-benzoxazin-4-ones undergo ring opening by moisture. In this work we report the reactions of 1-substituted-(4H)-3,2-benzoxazin-4-one 1 with nitrogen and carbon nucleophiles, with the aim of obtaining some precise information about the course of the reaction and on the other hand, to contrast the reactivity of 3,2-benzoxazin-4-one and 3,1-benzoxazin-4-one rings.

2-(3',4'-Dimethyl)benzoyl-3,4,5,6-tetrachloro benzoic acid reacts with hydroxylamine hydrochloride in boiling pyridine to give (4H)-3,2-benzoxazin-4-one 1. IR spectrum of 1 exhibits strong absorption bands at 1745 and 1650 cm^{-1} attributable to $\nu\text{C}=\text{O}$ and $\nu\text{C}=\text{N}$ respectively.

Recently [2] it has been reported that 2-substituted-3,1-benzoxazin-4-ones reacted with hydrazine hydrate to give the quinazoline derivatives. In the present study, reaction of 3,2-benzoxazin-4-one 1 with hydrazine hydrate in boiling ethanol gave the bis-phthalazinone derivative 2 via the double hetero ring opening followed by cyclization. IR spectrum

of 2 exhibits strong absorption bands at 1690, 1650 cm^{-1} due to $\nu\text{C}=\text{O}$ and $\nu\text{C}=\text{N}$ and lacks any bands characteristics for OH and NH groups.

Aminolysis of benzoxazinone 1 with primary aromatic amines, namely, aniline and p-anisidine in boiling ethanol gave the phthalazinone derivatives 3a and b respectively. IR spectra of compound 3 showed bands characteristic of $\nu\text{C}=\text{O}$ and $\nu\text{C}=\text{N}$ in the region of 1670-1660 and 1640-1630 cm^{-1} respectively. The $^1\text{H-NMR}$ (CDCl_3) spectrum of 3a showed signals at δ 2.3 (s, 6H, Ar- CH_3) and 7.0 - 8.0 ppm (m, 8H, Ar- H).

In this work we report the conversion of (4H)-3,2-benzoxazin-4-one derivative to (4H)-3,1-benzoxazin-4-one derivative bearing a bulky substituent in position-2, with the aim of increasing its stability. Thus, when benzoxazinone 1, submitted to react with anthranilic acid in boiling n-butanol afford 2-substituted-(4H)-3,1-benzoxazin-4-one 4a. The IR spectrum of 4a displayed strong absorption bands at 1725, 1630 and 3350 cm^{-1} characteristic for $\nu\text{C}=\text{O}$, $\nu\text{C}=\text{N}$ and νOH respectively. The ^1H -
