[^0]Introduction. - Recently, we have isolated several novel diterpenoids from Isodon plants [1-5]. Isodon lophanthoids (Buch.-Ham. Ex D Don) Hara has been used for treatment of acute hepatitis, cholecystitis, enteritis, dysentery, and trauma in folk medicine [6]. Some studies on this species and its variations have led to the isolation of a series of abietane diterpenoids [7-9]. In the course of our search for novel bioactive diterpenoids from Isodon species, we have investigated I. lophanthoids var. micranthus (C. Y. Wu) H. W. Li, a perennial herb collected in the southwest of Yunnan Province (China). The continuation of our previous work [10] resulted in the isolation of a minor constituent, a novel $13(12 \rightarrow 11)$ abeo-abietanoid named micranthin $C(\mathbf{1})$, along with three known abietane quinones, 16 -acetoxy- $7 \alpha$-hydroxyroyleanone (2) [11], 16-acetoxy-7 $\alpha$-methoxyroyleanone (3) [12], and hyptol (4) [13]. Here, we present the isolation and structure elucidation of the unique compound $\mathbf{1}$, accomplished by spectroscopic techniques, especially 1D and 2D NMR, as well as by X-ray diffraction analysis.

Results and Discussion. - Compound 1 was obtained as colorless needles. It showed a molecular-ion peak at $m / z 348$ in the EI-MS, consistent with the molecular formula $\mathrm{C}_{20} \mathrm{H}_{28} \mathrm{O}_{5}$, as confirmed by HR-EI-MS ( 348.193665 , calc.: 348.193674 ) and by NMR. The ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}$-NMR, HMQC, and HMBC spectra, as well as an X-ray crystalstructure, established that $\mathbf{1}$ corresponds to $7 \alpha, 11 \alpha$-dihydroxy-14-oxo-13(12 $\rightarrow 11$ )abeo-abieta-8-en-12,16-olide.

The characteristic UV absorption at 239 nm and IR bands at 1738 and $1634 \mathrm{~cm}^{-1}$ indicated the presence of an $\alpha, \beta$-unsaturated ketone. The ${ }^{13} \mathrm{C}$-NMR signals indicated two $\mathrm{C}=\mathrm{O} \mathrm{C}$-atoms, five quaternary C -atoms (including an oxygenated one and two tetrasubstituted olefinic ones), four methines (including an oxymethine), five

1

3

2

4
methylenes (including an oxymethylene), and four Me groups, suggesting a diterpenoid skeleton. Consideration of the predominant abietane diterpenoids isolated from Isodon lophanthoids and its variations, together with the typical ${ }^{1} \mathrm{H}-\mathrm{NMR}$ signals of three Me groups (next to tertiary C-atoms) at $\delta(\mathrm{H}) 0.82,0.94,1.25(3 s)$ and one Me group (next to a secondary center) at $\delta(\mathrm{H}) 1.05(d, J=7.3 \mathrm{~Hz})$, one oxymethylene at $\delta(\mathrm{H}) 4.07 / 4.19$ (each 1 H , br. $d, J=11.3 \mathrm{~Hz}$ ), indicated that $\mathbf{1}$ presumably had an abietane diterpenoid skeleton.

From HMQC and HMBC experiments, a long-range correlation between Me(20) at $\delta(\mathrm{H}) 1.25(s)$ and an olefinic C-atom at $\delta(\mathrm{C}) 178.1(s)$ was apparent, which led to the conclusion that the olefinic C -atom was $\mathrm{C}(9)$. From the electron distribution in the $\alpha, \beta$ unsaturated ketone and due to another quaternary olefinic C -atom at relatively high field $(\delta(\mathrm{C}) 142.5(s)$ ), the second olefinic C -atom was $\mathrm{C}(8)$, and the ketone $\mathrm{C}=\mathrm{O}$ group was either at $\mathrm{C}(7)$ or $\mathrm{C}(14)$. Moreover, $\mathrm{H}-\mathrm{C}(5)$ at $\delta(\mathrm{H}) 2.11(d, J=13.3 \mathrm{~Hz})$ exhibited a cross-peak with $\mathrm{C}(7)(\delta(\mathrm{H}) 59.4(d))$, and $\mathrm{H}-\mathrm{C}(7)(\delta(\mathrm{H}) 4.95(d, J=4.0 \mathrm{~Hz}))$ showed correlations with the two olefinic C -atoms $\mathrm{C}(8)$ and $\mathrm{C}(9)$ in the HMBC spectrum. This indicated that $\mathrm{C}(7)$ was hydroxylated and that the ketone $\mathrm{C}=\mathrm{O}$ group was, therefore, attributable to $\mathrm{C}(14)$.

As typically observed in common abietane diterpenoids from Isodon plants, $\mathrm{H}-\mathrm{C}(13)$ at $\delta(\mathrm{H}) 2.84(d, J=0.8 \mathrm{~Hz})$ of $\mathbf{1}$ showed HMBC couplings to $\mathrm{C}(15)(\delta(\mathrm{C})$ $33.0(d)), \mathrm{C}(16)(70.7(t))$, and $\mathrm{C}(17)(17.1(q))$. However, surprisingly the long-range cross-peak between $\mathrm{H}-\mathrm{C}(13)$ and $\mathrm{C}(9)$ was clearly observed in the HMBC spectrum of $\mathbf{1}$ (Fig. 1), which implied a dramatic difference between $\mathbf{1}$ and conventional abietane diterpenoids. This and further data analysis prompted us to assume that the $C(12)-C(13)$ abietane bond was split and that a new bond was formed between $C(11)$ and $C(13)$ in $\mathbf{1}$, leading to a $13(12 \rightarrow 11)$ abeo-abietane skeleton. The new D-ring could then have formed through lactonization. In this way, the above difference could be nicely explained. The HMBC correlations between $\mathrm{CH}_{2}(16)(\delta(\mathrm{H})$ 4.07/4.19 (each

1 H , br. $d, J=11.3 \mathrm{~Hz})$ ) and both the lactone $\mathrm{C}=\mathrm{O} \mathrm{C}$-atom $(\delta(\mathrm{C}) 174.8(s))$ and $\mathrm{C}(13)$ $(\delta(\mathrm{C}) 62.3(d))$, as well as between $\mathrm{H}-\mathrm{C}(15)(\delta(\mathrm{H}) 2.52(m)), \mathrm{C}(11)(\delta(\mathrm{C}) 78.9(s))$, and $\mathrm{C}(14)(\delta(\mathrm{C}) 207.0(s))$ supported the above hypothesis.

Fig. 1. Key correlations of $\mathbf{1}$ in the HMBC spectrum

The $\mathrm{C}(7)-\mathrm{OH}$ group adopted an $\alpha$-orientation according to the absence of a correlation between $\mathrm{H}-\mathrm{C}(7)$ and $\mathrm{H}_{\alpha}-\mathrm{C}(5)$ in the ROESY spectrum. However, the relative configurations at $\mathrm{C}(11), \mathrm{C}(13)$, and $\mathrm{C}(15)$ could not be settled at this stage. Fortunately, compound $\mathbf{1}$ could be finally crystallized. Single-crystal X-ray diffraction [14] then established not only the configuration of all stereogenic centers $(\mathrm{OH}(11)$, $\mathrm{H}-\mathrm{C}(13)$, and $\mathrm{Me}(17)$ in $\alpha$ position), but also confirmed the proposed skeleton (Fig. 2). Consequently, 1 corresponds to $7 \alpha, 11 \alpha$-dihydroxy-14-oxo-13(12 $\rightarrow 11$ )abeo-abieta-8-en-12,16-olide, which we have named micranthin C. Although the rearrangement in ring $C$ of abietane diterpenoids has been reported before [14-18], compound $\mathbf{1}$ is an unprecedented natural diterpenoid with a $13(12 \rightarrow 11)$ abeo-abietane skeleton.

Scheme. Postulated Biogenetic Pathway Leading to Micranthin C (1)

b)

Fig. 2. a) X-Ray crystal structure of 1. b) Lattice geometry.

From a biogenetic point of view, the precursor of $\mathbf{1}$ may be 16 -acetoxy- $7 \alpha-$ hydroxyroyleanone (2), which has been isolated from the same plant. A plausible biogenetic pathway is shown in the Scheme, in which oxidation, nucleophilic ring closure, and esterification are probably responsible for the above transformation.

## Experimental Part

General. M.p.: XRC-1 Micro-melting-point apparatus, uncorrected. Optical rotations: JASCO DIP-370 digital polarimeter. UV Spectra: Shimadzu UV-210A spectrometer; $\lambda_{\max }$ in $n m(\log \varepsilon)$. IR Spectra: Bio-Rad FtS135 spectrometer with KBr pellets; in $\mathrm{cm}^{-1}$. Mass spectra: $V G$ Autospec- 3000 spectrometer; 70 eV for $\mathrm{EI} ; \mathrm{m} / \mathrm{z}$
(rel. \%). NMR Spectra: Bruker $A M-400$ and $D R X-500$ spectrometers; $\delta$ in ppm, $J$ in Hz, SiMe ${ }_{4}$ as internal standard, in $\left(\mathrm{D}_{5}\right)$ pyridine.

Plant Material. The aerial part of I. lophanthoides var. micranthes C. Y. Wu were collected in Tenchong, Yunnan (China) in October 2001 and identified by Prof. Zhong-Wen Lin. A voucher specimen (KIB 001-01) of this plant was deposited at the Kunming Institute of Botany, Kunming, China.

Extraction and Isolation. The air-dried plants ( 7.2 kg ) were extracted with $70 \%$ aq. acetone at r.t. overnight $(4 \times)$, and filtered. The filtrate was concentrated in vavcuo, and the residue was partitioned between $\mathrm{H}_{2} \mathrm{O}$ and AcOEt. The AcOEt-soluble fraction $(60 \mathrm{~g})$ was subjected to $\mathrm{CC}\left(\mathrm{SiO}_{2} ; \mathrm{CHCl}_{3} / \mathrm{Me}_{2} \mathrm{CO}(1: 0 \rightarrow 9: 1 \rightarrow 4: 1 \rightarrow\right.$ $7: 3)$. Compound $\mathbf{1}(7 \mathrm{mg}), \mathbf{2}(29 \mathrm{mg}), \mathbf{3}(68 \mathrm{mg})$, and $\mathbf{4}(15 \mathrm{mg})$ were obtained by repeated $\mathrm{CC}\left(\mathrm{SiO}_{2}\right.$ and Sephadex LH-20; $\mathrm{CHCl}_{3} / \mathrm{Me}_{2} \mathrm{CO} 1: 0$ and $\left.9: 1\right)$.

Micranthin $C(=7 \alpha, 11 \alpha$-dihydroxy-14-oxo-13(12 $\rightarrow$ 11) abeo-abieta-8-en-12,16-olide; $\mathbf{1})$. Colorless needles. M.p. $174-176^{\circ} .[\alpha]_{\mathrm{D}}^{25}=-30.77(c=0.13, \mathrm{MeOH})$. UV (MeOH): 239 (3.50). IR (KBr): 3439, 2957, 2930, 2872, 1738, 1717, 1651, 1634, 1627, 1472, 1457, 1373, 1252, 1177, 1103, 1058, 1025, 997, 945, 742, 669, 528. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ $\left(\mathrm{C}_{5} \mathrm{D}_{5} \mathrm{~N}, 400 \mathrm{MHz}\right): 4.95\left(d, J(7 \beta-6 \beta)=4.0, \mathrm{H}_{\beta}-\mathrm{C}(7)\right) ; 4.19$ (br. $\left.d, J=11.3, \mathrm{H}_{\beta}-\mathrm{C}(16)\right) ; 4.07$ (br. $d, J=11.3$, $\left.\mathrm{H}_{\alpha}-\mathrm{C}(16)\right) ; 2.86\left(m, \mathrm{H}_{\beta}-(\mathrm{C}(1)) ; 2.84 \quad\left(d, J(13 \alpha, 15 \beta)=0.8, \mathrm{H}_{\alpha}-\mathrm{C}(13)\right) ; 2.52 \quad\left(m, \mathrm{H}_{\beta}-\mathrm{C}(15)\right) ; 2.11\right.$ $\left(d, J(5 \alpha, 6 \beta)=13.3, \mathrm{H}_{\alpha}-\mathrm{C}(5)\right) ; 2.09\left(m, \mathrm{H}_{\alpha}-\mathrm{C}(1)\right) ; 2.08\left(d, J(6 \alpha, 6 \beta)=13.3, \mathrm{H}_{\alpha}-\mathrm{C}(6)\right) ; 1.76(d t, J(6 \beta, 5 \alpha)=$ $\left.J(6 \beta, 6 \alpha)=13.3, J(6 \beta, 7 \beta)=4.0, \mathrm{H}_{\beta}-\mathrm{C}(6)\right) ; 1.55\left(m, \mathrm{H}_{\beta}-\mathrm{C}(2)\right) ; 1.37\left(m, \mathrm{H}_{\alpha}-\mathrm{C}(2)\right) ; 1.31 \quad($ br. $d, J=10.3$, $\left.\mathrm{H}_{\alpha}-\mathrm{C}(3)\right) ; 1.25(s, \mathrm{Me}(20)) ; 1.10$ (overlapping, $\left.\mathrm{H}_{\beta}-\mathrm{C}(3)\right) ; 1.05(d, J=7.3, \mathrm{Me}(17)) ; 0.94(s, \mathrm{Me}(18)) ; 0.82$ $(s, \operatorname{Me}(19)) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{C}_{5} \mathrm{D}_{5} \mathrm{~N}, 100 \mathrm{MHz}\right): 34.9(t, \mathrm{C}(1)) ; 18.6(t, \mathrm{C}(2)) ; 41.6(t, \mathrm{C}(3)) ; 33.4(s, \mathrm{C}(4)) ; 46.9$ $(d, \mathrm{C}(5)) ; 28.7(t, \mathrm{C}(6)) ; 59.4(d, \mathrm{C}(7)) ; 142.5(s, \mathrm{C}(8)) ; 178.1(s, \mathrm{C}(9)) ; 41.5(s, \mathrm{C}(10)) ; 78.9(s, \mathrm{C}(11)) ; 174.8$ $(s, \mathrm{C}(12)) ; 62.3(d, \mathrm{C}(13)) ; 207.0(s, \mathrm{C}(14)) ; 33.0(d, \mathrm{C}(15)) ; 70.7(t, \mathrm{C}(16)) ; 17.1(q, \mathrm{C}(17)) ; 33.7(q, \mathrm{C}(18)) ; 22.0$ $(q, \mathrm{C}(19)) ; 18.7(q, \mathrm{C}(20)) . \mathrm{EI}-\mathrm{MS}: 348\left(52, M^{+}\right), 330\left(50,\left[M-\mathrm{H}_{2} \mathrm{O}\right]^{+}\right), 312\left(54,\left[M-2 \mathrm{H}_{2} \mathrm{O}\right]^{+}\right), 302(20), 286$ (71), 271 (66), $247(35), 233(24), 217(29), 202(72), 187(69), 173(21), 163(19), 140(33), 123(75), 109(51)$, 95 (40), 83 (78), 69 (96). HR-EI-MS: $348.193665\left(M^{+}, \mathrm{C}_{20} \mathrm{H}_{28} \mathrm{O}_{5}^{+}\right.$; calc. 348.193674).
$X$-Ray Crystal Structure of 1. Colorless, transparent, column-like single crystal $(0.15 \times 0.30 \times 0.60 \mathrm{~mm})$; formula (formula weight): $\mathrm{C}_{20} \mathrm{H}_{28} \mathrm{O}_{5}\left(348.44 \mathrm{~g} \mathrm{~mol}^{-1}\right)$; crystal system: orthorhombic; space group: $P 2_{1} 2_{1} 2_{1}$; lattice parameters: $a=8.1830(2), b=10.8520(5), c=20.1230\left(10 \AA, V=1786.96(13) \AA^{3} ; Z=4, d=1.295 \mathrm{~g} \mathrm{~cm}^{-3}\right.$; Mo $K_{\alpha}$ radiation, $M A C D I P-2030 K$ diffractometer; maximum $2 \theta$ range: $50.0^{\circ}$; total reflections observed (collected): 1784 (1780); data analysis: $|F|^{2}>8 \sigma|F|^{2}$. Rings A and B are trans, in chair- and half-chair conformations, resp., whereas rings C and D are cis, in planar and boat conformations, resp. $\mathrm{HO}-\mathrm{C}(7)$, $\mathrm{H}-\mathrm{C}(13)$, and $\mathrm{Me}(17)$ are all $\alpha$-oriented, i.e., they lie below the molecular plane. The crystallographic data (excluding structure factors) for $\mathbf{1}$ have been deposited with the Cambridge Crystallographic Data Centre as deposition No. CCDC 219060. Copies of the data can be obtained, free of charge, on application to the CCDC, 12 Union Road, Cambridge CB21EZ UK (fax: + 44(1223)336033; e-mail: deposit@ccdc.cam.ac.uk).
