## S Supporting Information

#### Abstract

Five new vobasinyl-ibogan-type bisindole alkaloids, tabernaricatines $A-E \quad(1-5)$, two new monomers, tabernaricatines F and G (6 and 7), and 24 known indole alkaloids were isolated from the aerial parts of Tabernaemontana divaricata. Alkaloids 1 and 2 are the first vobasinyl-ibogan-type alkaloids possessing a six-membered ring via an ether linkage between $\mathrm{C}-17$ and $\mathrm{C}-21$. All compounds except for 3 were evaluated for their cytotoxicity against five human cancer cell lines; conophylline showed significant bioactivity against HL-60, SMMC-7721, A-549, MCF-7, and SW480 cells with $\mathrm{IC}_{50}$ values of $0.17,0.35,0.21,1.02$, and $1.49 \mu \mathrm{M}$, respectively.

Monoterpenoid indole alkaloids (MIAs) play an important role in natural products due to their complicated structures and biological activities. ${ }^{1}$ Additionally, bisindole alkaloids are well known for their antitumor bioactivity, e.g., vincristine derivatives. ${ }^{2}$ Plants of the genus Tabernaemontana are rich in MIAs, especial their dimeric forms. ${ }^{3,4}$ The genus includes about 120 species and are distributed mainly in the tropical and subtropical areas of Asia and Australia. Many of these species are used in folk medicine for the treatment of abdominal pain, hypertension, and sore throat. ${ }^{5}$ In our previous study of this genus, a series of cytotoxic monoterpenoid indole and bisindole alkaloids were reported. ${ }^{6}$ As a continuation of our studies on bioactive MIAs from Apocynaceae, we investigated the constituents of Tabernaemontana divaricata. As a result, seven new (1-7) and 24 known alkaloids were identified. The known alkaloids were identified as ervachinine $C,{ }^{7}$ ervachinine $A,{ }^{7}$ ervachinine $B,{ }^{7}$ tabernaecorymbosine $A,{ }^{6}$ tabernaecorymbosine $\mathrm{B},{ }^{6}$ cononitarine $\mathrm{B},{ }^{8}$ conofoline, ${ }^{9}$ conophylline, ${ }^{9}$ hydroxyindolenine, ${ }^{10}$ voacangine hydroxyindolenine, ${ }^{11}$ voacristina hydroxyindolenina, ${ }^{12}$ 3-(2-oxopropyl)voacangine, ${ }^{13}$ voacristina, ${ }^{12}$ ibogaine, ${ }^{14}$ voacristine, ${ }^{15}$ tabernanthine, ${ }^{16}$ isovoacangine, ${ }^{17} 19$-epi-isovoacristine, ${ }^{18} 19 S$-heyneanine, ${ }^{19} 1$-methylvoaphylline, ${ }^{20}$ voaphyllinediol, ${ }^{21}$ 19,20-E-vallesamine, ${ }^{22}$ and picrinine. ${ }^{23}$ The cytotoxicity of these compounds against five human cancer cell lines was evaluated.

## RESULTS AND DISCUSSION

Alkaloid 1 was isolated as a colorless powder. The UV absorption bands at 292, 285, and 222 nm suggested an indole chromophore, ${ }^{24}$ while the IR absorption bands at 3388 and $1728 \mathrm{~cm}^{-1}$ resulted from the -NH and ester carbonyl groups. The molecular formula of 1 was established as $\mathrm{C}_{44} \mathrm{H}_{52} \mathrm{~N}_{4} \mathrm{O}_{7}$ by HREIMS ([M] ${ }^{+}$at $m / z$ 748.3854), indicating 21 indices of
hydrogen deficiency. Its ${ }^{1} \mathrm{H}$ NMR spectrum (Table 1) displayed two indole NH signals at $\delta_{\mathrm{H}} 9.75(1 \mathrm{H}, \mathrm{br}$ s) and $7.37(1 \mathrm{H}, \mathrm{br}$ s); an unsubstituted indole moiety with signals at $\delta_{\mathrm{H}} 7.72(1 \mathrm{H}$, $\mathrm{d}, J=7.2 \mathrm{~Hz}), 7.04(1 \mathrm{H}, \mathrm{t}, J=7.2 \mathrm{~Hz}), 7.06(1 \mathrm{H}, \mathrm{t}, J=7.2 \mathrm{~Hz})$, and $7.12(1 \mathrm{H}, \mathrm{d}, J=7.2 \mathrm{~Hz})$; a disubstituted indole moiety with signals at $\delta_{\mathrm{H}} 7.22(1 \mathrm{H}, \mathrm{d}, J=8.6 \mathrm{~Hz})$ and $6.85(1 \mathrm{H}, \mathrm{d}, J=8.6$ $\mathrm{Hz})$; one aromatic methoxy group at $\delta_{\mathrm{H}} 3.94(3 \mathrm{H}, \mathrm{s})$ together with a nitrogen methyl ( $\delta_{\mathrm{H}} 2.66,3 \mathrm{H}, \mathrm{s}$ ); and two methyl ester groups ( $\delta_{\mathrm{H}} 2.28$ and 3.71 , each $3 \mathrm{H}, \mathrm{s}$ ). The former ester methyl, associated with the vobasine unit (unit A, Figure 2), was unusually shielded ( $\delta_{\mathrm{H}} 2.28$ ) by the aromatic ring. ${ }^{8}$ The ${ }^{13} \mathrm{C}$ NMR and DEPT spectra of $\mathbf{1}$ (Table 2), in association with the MS spectrum, suggested that 1 possessed 44 carbons, including six methyl, nine methylene, 14 methine, and 15 quaternary carbons. Compound 1 was thus readily identified as a bisindole alkaloid, comprising a vobasinyl-type unit (A) and an ibogan-type unit (B) (Figure 2), similar to conodiparine B (Figure 1). ${ }^{8}$ A significant difference was the presence of a sixmembered ring formed via an ether linkage between $\mathrm{C}-17$ and $\mathrm{C}-21$ in unit A, as supported by the HMBC correlations of H $21\left(\delta_{\mathrm{H}} 3.62, \mathrm{~s}\right)$ with C-5 ( $\delta_{\mathrm{C}} 62.9$ ), C-15 ( $\delta_{\mathrm{C}} 43.5$ ), C-17 ( $\delta_{\mathrm{C}}$ 73.1), and C-19 ( $\delta_{\mathrm{C}} 59.1$ ) and of H-17 ( $\delta_{\mathrm{H}} 3.69, \mathrm{~m}$ ) with C-5 ( $\delta_{\mathrm{C}} 62.9$ ), C-21 ( $\delta_{\mathrm{C}} 90.1$ ), and C-15 ( $\delta_{\mathrm{C}} 43.5$ ). An oxirane involving C-19 ( $\delta_{\mathrm{C}} 59.1$ ) and C-20 ( $\delta_{\mathrm{C}} 65.2$ ) was confirmed by their typical chemical shifts in unit A , which was also supported by correlations of $\mathrm{H}-19\left(\delta_{\mathrm{H}} 3.03 \mathrm{q}, J=5.6 \mathrm{~Hz}\right)$ with $\mathrm{C}-18$ and $\mathrm{C}-21$ in its HMBC spectrum. In unit B , a hydroxy group was absent at $\mathrm{C}-19^{\prime}$ in $\mathbf{1}$ compared with conodiparine $\mathrm{B},{ }^{8}$ as confirmed by the upfield shifts of the carbon resonances at $\delta_{\mathrm{C}}$

11.8 ( $q, C-18^{\prime}$ ) and 27.4 ( $\mathrm{t}, \mathrm{C}-19^{\prime}$ ) in the ${ }^{13} \mathrm{C}$ NMR and DEPT spectra and corresponding protons $\mathrm{H}-18^{\prime}\left(\delta_{\mathrm{H}} 0.81,3 \mathrm{H}, \mathrm{t}, J=\right.$ 7.4 Hz) and $\mathrm{H}-19^{\prime}\left(\delta_{\mathrm{H}} 1.30,1.43\right.$, each $\left.1 \mathrm{H}, \mathrm{m}\right)$ in the ${ }^{1} \mathrm{H}$ NMR spectrum. The assumption was further supported by correlations of $\mathrm{H}-18^{\prime}$ with $\mathrm{C}-19^{\prime}$ and $\mathrm{C}-20^{\prime}\left(\delta_{\mathrm{C}} 39.4\right)$ in the HMBC spectrum. Finally, the linkage of units A and B by C-3 and C-12' was established by the HMBC correlations of $\mathrm{H}-3$ ( $\delta_{\mathrm{H}} 4.93, \mathrm{br} \mathrm{d}, J=12.2 \mathrm{~Hz}$ ) with $\mathrm{C}-12^{\prime}\left(\delta_{\mathrm{C}} 115.8\right)$, $\mathrm{C}-13^{\prime}\left(\delta_{\mathrm{C}}\right.$ 135.9), C-2 ( $\delta_{\mathrm{C}} 138.7$ ), and C-15 ( $\delta_{\mathrm{C}} 43.5$ ) (Figure 2); a noticeable upfield shift of both the $\mathrm{C}-17^{\prime}$ methylene protons at
$\delta_{\mathrm{H}} 0.54$ and 1.66 confirmed the mode of branching of the monomeric units. ${ }^{8}$ The NOE correlations of $\mathrm{H}-19 / \mathrm{H}-21, \mathrm{H}-$ 21/H-22 $\left(\mathrm{NCH}_{3}\right)$, and H-22/H-5 in the ROESY spectrum indicated that the relative configuration of $\mathbf{1}$ was the same as that of conodiparine B (Figure 1). ${ }^{8}$ A detailed analysis of the 2D NMR data (HSQC, HMBC, ROESY) established the structure of $\mathbf{1}$ to be as shown, and it was named tabernaricatine A.

Compound 2 had the molecular formula $\mathrm{C}_{44} \mathrm{H}_{54} \mathrm{~N}_{4} \mathrm{O}_{6}$, established by HREIMS ([M] ${ }^{+}$at $m / z$ 734.3969), with 20

Figure 1. Alkaloids (1-7) isolated from T. divaricata.

Figure 2. Key HMBC correlations of $\mathbf{1 .}$
indices of hydrogen deficiency. The UV spectrum displayed absorption maxima characteristic of indole chromophores at 285 and 222 nm , and the IR spectrum showed absorption bands due to $-\mathrm{NH}\left(3405 \mathrm{~cm}^{-1}\right)$ and ester carbonyl (1727 $\mathrm{cm}^{-1}$ ) functions. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data (Tables 1 and 2) were similar to those of $\mathbf{1}$, except that the oxirane between C -19 and C-20 was reduced, as supported by the molecular formula and the HMBC correlations of $\mathrm{H}-19\left(\delta_{\mathrm{H}} 1.45\right.$ and 1.49, each $1 \mathrm{H}, \mathrm{m}$ ) with C-21 ( $\delta_{\mathrm{C}} 87.0$ ), C-20 ( $\delta_{\mathrm{C}} 51.4$ ), C-15 ( $\delta_{\mathrm{C}} 41.2$ ), and $\mathrm{C}-18\left(\delta_{\mathrm{C}} 12.3\right)$. Taking the degrees of unsaturation into consideration confirmed the absence of the oxirane ring. Analysis of the 2D NMR data confirmed that the other parts were the same as those of 1 . Hence, the structure of 2 was elucidated as shown, and it was named tabernaricatine B .

The molecular formula $\mathrm{C}_{44} \mathrm{H}_{52} \mathrm{~N}_{4} \mathrm{O}_{6}$ of 3 was established by the molecular ion peak at $m / z 732.3726$ in the HREIMS. The

UV absorption bands at 295 and 225 nm and IR absorption bands at 3424 and $1723 \mathrm{~cm}^{-1}$ were characteristic of indole alkaloids. In the ${ }^{1} \mathrm{H}$ NMR spectrum, signals typical of an unsubstituted indole moiety (vobasine unit) were observed at $\delta_{\mathrm{H}} 7.09(1 \mathrm{H}, \mathrm{d}, J=7.5 \mathrm{~Hz}), 7.62(1 \mathrm{H}, \mathrm{t}, J=7.5 \mathrm{~Hz}), 7.09(1 \mathrm{H}$, $\mathrm{t}, J=7.5 \mathrm{~Hz})$, and $7.04(1 \mathrm{H}, \mathrm{d}, J=7.5 \mathrm{~Hz})$. Two aromatic singlets appeared at $\delta_{\mathrm{H}} 6.83$ and 6.80 , indicating a $10^{\prime}, 11^{\prime}$ disubstituted indole moiety (iboga unit; Table 1). The ${ }^{13} \mathrm{C}$ NMR and DEPT spectra showed 44 signals arising from two methyl ( $\delta_{\mathrm{C}} 11.8$ and 11.8), three methoxy ( $\delta_{\mathrm{C}} 50.5,52.7$, and 56.0), two ester carbonyl ( $\delta_{\mathrm{C}} 173.6$ and 176.0 ), $11 \mathrm{sp}^{2}$ quaternary carbon ( $\delta_{\mathrm{C}} 153.4,141.2,137.4,136.3,135.4$, $134.8,129.9,127.3,122.5,110.2$, and 110.1 ), two $\mathrm{sp}^{3}$ quaternary carbon ( $\delta_{\mathrm{C}} 55.1$ and 47.0 ), seven $\mathrm{sp}^{2}$ methine ( $\delta_{\mathrm{C}}$ $121.9,119.1,118.0,117.7,114.0,110.0$, and 92.7), six sp ${ }^{3}$ methine ( $\delta_{\mathrm{C}} 61.0,57.7,39.6,39.3,37.0$, and 27.4 ), and $11 \mathrm{sp}^{2}$ methylene ( $\delta_{\mathrm{C}} 88.4,76.7,53.1,51.5,50.0,38.3,36.6,32.1,26.8$, 25.5 , and 22.2) carbons. Besides these, two low-field signals were observed at $\delta_{\mathrm{C}} 76.7(\mathrm{t}, \mathrm{C}-17)$ and $\delta_{\mathrm{C}} 88.4(\mathrm{t}, \mathrm{C}-22)$. The nitrogen methyl signals were conspicuously absent, which suggested an ether bond between C-22 (nitrogen methyl) and $\mathrm{C}-17$ in unit A . This was also confirmed by the observed HMBC correlations of $\mathrm{H}-22\left(\delta_{\mathrm{H}} 4.62,4.74\right)$ to C-21 ( $\delta_{\mathrm{C}} 50.0$ ), C-17 ( $\delta_{\mathrm{C}} 76.7$ ), and C-5 ( $\delta_{\mathrm{C}} 61.0$ ). The NMR data (Tables 1 and 2) were closely related to those of conodirinine $\mathrm{A},{ }^{25}$ except for a signal at $\delta_{\mathrm{C}} 26.8\left(\mathrm{t}, \mathrm{C}-19^{\prime}\right)$ in the ${ }^{13} \mathrm{C}$ NMR spectrum of 3 instead of a signal for an oxymethine in conodirinine A . Therefore, 3 was elucidated as shown by analysis of 2D NMR data (HSQC, HMBC, ROESY), and it was named tabernaricatine C .

${ }^{a}$ Compound 3 in $\mathrm{CDCl}_{3} ; 1,2,4$, and 5 in acetone- $d_{6}$.

Compound 4 possessed the molecular formula $\mathrm{C}_{44} \mathrm{H}_{52} \mathrm{~N}_{4} \mathrm{O}_{6}$ as determined by HREIMS. The UV ( 285 and 222 nm ) and IR data ( 3433 and $1725 \mathrm{~cm}^{-1}$ ) showed the characteristic absorptions of indole chromophores. Comparison of the NMR data of 4 with those of 3 suggested the linkage of the vobasine and iboga units via $\mathrm{C}-3 / 12^{\prime}$ in 4 , rather than via $\mathrm{C}-3$ / $10^{\prime}$ as in 3, which was supported by the coupling constants of the aromatic protons at $\delta_{\mathrm{H}} 7.20\left(1 \mathrm{H}, \mathrm{d}, J=8.6 \mathrm{~Hz}, \mathrm{H}-9^{\prime}\right)$ and $6.84\left(1 \mathrm{H}, \mathrm{d}, J=8.6 \mathrm{~Hz}, \mathrm{H}-10^{\prime}\right)$ in 4 . The assumption was further supported by the HMBC correlations of H-3 ( $\delta_{\mathrm{H}} 5.30$, br d, $J=13.6 \mathrm{~Hz}$ ) with C-11' ( $\delta_{\mathrm{C}} 152.8$ ), C-12' ( $\delta_{\mathrm{C}} 116.2$ ), and
$\mathrm{C}-13^{\prime}\left(\delta_{\mathrm{C}} 135.9\right)$. Analysis of 2D NMR data confirmed that the other parts were identical to those of 3 . Hence, the structure of 4 was elucidated as shown, and it was named tabernaricatine D. Compound 5 was isolated as a light yellow powder. Its UV spectrum showed absorption maxima at 295 and 227 nm , suggesting indole chromophores, and the IR spectrum showed $-\mathrm{NH}\left(3440 \mathrm{~cm}^{-1}\right)$, ester carbonyl ( $1725 \mathrm{~cm}^{-1}$ ), and carbonyl ( $1711 \mathrm{~cm}^{-1}$ ) bands. The molecular formula $\mathrm{C}_{47} \mathrm{H}_{58} \mathrm{~N}_{4} \mathrm{O}_{7}$ was established by HREIMS ( $\mathrm{m} / z 790.4297[\mathrm{M}]^{+}$), which is 56 Da higher than that of ervachinine C. ${ }^{7}$ Analysis of the NMR data (Tables 1 and 2) indicated that 5 was also a vobasinyl-ibogan
bisindole alkaloid, and it was readily identified as a 2 -oxopropyl derivative of ervachinine $\mathrm{C}^{7}$ by the presence of signals at $\delta_{\mathrm{C}}$ 208.2 (s), $46.6(\mathrm{t})$, and 30.7 (q) in its ${ }^{13} \mathrm{C}$ NMR spectrum. The 2-oxopropyl group was substituted at C-3', as supported by the HMBC correlations of $\mathrm{H}-3^{\prime}\left(\delta_{\mathrm{H}} 3.24\right)$ with the carbon at $\delta_{\mathrm{C}}$ 208.2. In the ROESY spectrum of $5, \mathrm{H}-17^{\prime} \alpha\left(\delta_{\mathrm{H}} 1.85\right)$ was correlated with $\mathrm{H}-15^{\prime} \alpha$; thus, the NOE correlation of $\mathrm{H}-3^{\prime}$ with $\mathrm{H}-17^{\prime} \beta\left(\delta_{\mathrm{H}} 2.68\right)$ suggested that $\mathrm{H}-3^{\prime}$ was $\beta$-oriented. Thus, the structure of 5 was elucidated and named tabernaricatine $E$.

The UV and IR spectra of 6 were similar to those of the above alkaloids. Its molecular formula, $\mathrm{C}_{23} \mathrm{H}_{30} \mathrm{~N}_{2} \mathrm{O}_{3}$, from HREIMS ( $[\mathrm{M}]^{+} m / z 382.2265$ ) indicatied a monomeric alkaloid with 10 indices of hydrogen deficiency. The ${ }^{13} \mathrm{C}$ NMR and DEPT spectra displayed 23 carbon resonances ascribed to three methyl, six methylene, eight methine, and six quaternary carbons (Table 3). In the ${ }^{1} \mathrm{H}$ NMR spectrum, three

signals [ $\delta_{\mathrm{H}} 6.88(\mathrm{~d}, J=2.5 \mathrm{~Hz}, \mathrm{H}-9), 6.80(\mathrm{dd}, J=8.3,2.5 \mathrm{~Hz}$, $\mathrm{H}-11), 7.21(\mathrm{~d}, J=8.3 \mathrm{~Hz}, \mathrm{H}-12)$ ] revealed the presence of a monosubsitituted A ring found in MIAs. A low-field signal at $\delta_{\mathrm{H}}$ 4.95 ( br s) was assigned to OH-7, as supported by the HMBC correlations with C-6 ( $\delta_{\mathrm{C}} 34.0$ ), C-7 ( $\delta_{\mathrm{C}} 88.1$ ), and C-2 ( $\delta_{\mathrm{C}}$ 191.5). These data were similar to those of hydroxyindolenine, ${ }^{10}$ with the exception of three additional carbon signals at
$\delta_{\mathrm{C}} 30.6(\mathrm{q}), 208.3(\mathrm{~s})$, and $47.2(\mathrm{t})$ in the ${ }^{13} \mathrm{C}$ NMR spectrum, which suggested that 6 was a 2 -oxopropyl derivative of hydroxyindolenine. Moreover, the HMBC correlation of H-3 ( $\delta_{\mathrm{H}} 3.26$ ) with the carbon at $\delta_{\mathrm{C}} 208.2$ placed the 2 -oxopropyl moiety at C-3. The NOE correlation of $7-\mathrm{OH} / \mathrm{H}-16$ indicated that the $7-\mathrm{OH}$ group was $\alpha$-oriented. Analysis of the 2D NMR data (HSQC, HMBC, ROESY) indicated that the rest of 6 was the same as that of hydroxyindolenine. The molecular formula of 7 was established as $\mathrm{C}_{23} \mathrm{H}_{30} \mathrm{~N}_{2} \mathrm{O}_{2}$ by HREIMS ( $[\mathrm{M}]^{+} \mathrm{m} / \mathrm{z}$ 366.2306). The ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, and DEPT data (Table 3) displayed signals for a monosubstituted indole ring [ $\delta_{\mathrm{C}} 143.7$ ( $\mathrm{s}, \mathrm{C}-2$ ), 108.5 ( $\mathrm{s}, \mathrm{C}-7$ ), 131.1 ( $\mathrm{s}, \mathrm{C}-8$ ), 100.7 (d, C-9), 154.5 ( s , $\mathrm{C}-10$ ), 111.5 (d, C-11), 110.8 (d, C-12), 131.1 ( $\mathrm{s}, \mathrm{C}-13$ ); $\delta_{\mathrm{H}}$ 6.89 (d, $J=1.9 \mathrm{~Hz}, \mathrm{H}-9), 7.10(\mathrm{dd}, J=8.6,1.9 \mathrm{~Hz}, \mathrm{H}-11), 6.64$ ( $\mathrm{d}, J=8.6 \mathrm{~Hz}, \mathrm{H}-12$ ) ]. The NMR data (Table 3) of 7 were similar to those of 3-(2-oxopropyl)voacangine ${ }^{13}$ except for the absence of an ester signal at $\mathrm{C}-16$ in 7 . This assignment was supported by the HMBC correlations of $\mathrm{H}-16\left(\delta_{\mathrm{H}} 1.35, \mathrm{~m}\right)$ with C-7 ( $\delta_{\mathrm{C}} 108.5$ ), C-14 ( $\delta_{\mathrm{C}} 30.7$ ), and C-20 ( $\delta_{\mathrm{C}} 42.2$ ). Similar to 5 , the ROESY correlation of $\mathrm{H}-17 \beta$ with $\mathrm{H}-3$ suggested that $\mathrm{H}-3$ was $\beta$-oriented. Thus, the structures of alkaloids 6 and 7 were elucidated and named tabernaricatines $F$ and G, respectively.

Alkaloids $\mathbf{1}$ and 2 are the first vobasinyl-ibogan-type alkaloids possessing a six-membered ring via an ether linkage between C-17 and C-21. The cytotoxicities of all alkaloids except 3 against five human cancer cell lines were evaluated using the MTT method reported previously. ${ }^{26}$ Cononitarine B and conophylline exhibited significant inhibitory effects against these five human cancer cell lines, and alkaloids 1, 7, ervachinine $A$, ervachinine $B$, ervachinine $C$, and conofoline displayed moderate cytotoxicity against some of the cell lines (Table 4).

## EXPERIMENTAL SECTION

General Experimental Procedures. Optical rotations were measured with a Horiba SEPA-300 polarimeter. UV spectra were obtained using a Shimadzu UV-2401A spectrometer. IR spectra were obtained by a Bruker FT-IR Tensor 27 spectrometer using KBr pellets. 1D and 2D NMR spectroscopic data were run on Bruker AVANCE III-600, DRX-500, and AM-400 MHz spectrometers with TMS as an internal standard. HREIMS was recorded on a Waters Auto Premier P776 spectrometer. Column chromatography (CC) was performed on silica gel (200-300 mesh, Qingdao Marine Chemical Ltd., Qingdao, People's Republic of China), RP-18 gel ( $20-45 \mu \mathrm{~m}$, Fuji Silysia Chemical Ltd., Japan), and Sephadex LH-20 (Pharmacia Fine Chemical Co., Ltd., Sweden). Fractions were monitored by TLC (GF 254, Qingdao Haiyang Chemical Co., Ltd., Qingdao), and spots were visualized by Dragendorff's reagent.

Plant Material. T. divaricata was collected from Xishuangbanna, Yunnan Province, P. R. China, and identified by Mr. Jing-Yun Cui, Xishuangbanna Tropical Botanical Garden, Chinese Academy of Sciences. A voucher specimen (No. Cui20091027) has been deposited at Kunming Institute of Botany, Chinese Academy of Sciences.

Extraction and Isolation. An air-dried and powdered sample (5 kg ) was extracted with $90 \%$ aqueous $\mathrm{MeOH}(2$ days $\times 3$ ) at room temperature with the solvent removed in vacuo. The extract was partitioned between EtOAc and a $0.5 \% \mathrm{HCl}$ solution. The water layer was adjusted to $\mathrm{pH} 9-10$ with $10 \%$ ammonia and partitioned with EtOAc to give an alkaloid extract layer. The total alkaloid mixture (42 g) was subjected to CC over silica gel and eluted with $\mathrm{CHCl}_{3} /$ acetone (from 1:0 to $1: 1, \mathrm{v} / \mathrm{v}$ ) to afford four fractions (I-IV). Fraction II (1.1 g ) was further applied to Si gel chromatography using a petroleum ether/EtOAc eluent (from 9:1 to 6:1, v/v) to yield isovoacangine ( 10 mg ), voacristine ( 6 mg ), 6 ( 3 mg ), 1-methylvoaphylline ( 15 mg ), ibogaine ( 50 mg ), voacristine hydroxyindolenine ( 20 mg ), and 7 ( 12 mg ). Fraction III ( 18.0 g ) was subjected to RP-18 $\left(\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}\right.$, from $1: 9$ to $1: 0, \mathrm{v} / \mathrm{v}$ ), affording five subfractions (IIIa-IIIe). Fraction IIIa ( 850 mg ) was subjected to silica gel CC and eluted with petroleum ether/acetone ( $5: 1, \mathrm{v} / \mathrm{v}$ ) to afford 19 -epi-isovoacristine ( 100 mg ), voacristine ( 14 mg ), and (19S)-heyneanine ( 25 mg ). Fraction IIIb ( 6.2 g) was subjected to silica gel CC and eluted with petroleum ether/ acetone (from 6:1 to 4:1, v/v) to give mixtures A and B. A and B were further purified by $\mathrm{C}_{18} \mathrm{CC}\left(\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}\right.$, from 6:4 to $\left.8: 2, \mathrm{v} / \mathrm{v}\right)$ to yield $3(5 \mathrm{mg}), 5(7 \mathrm{mg})$, tabernaecorymbosine A $(180 \mathrm{mg})$, tabernaecorymbosine B ( 12 mg ), cononitarine B ( 5 mg ), ervachinine C ( 35 mg ), and voaphyllinediol ( 15 mg ). Fraction IIIc ( 2.1 g ) was separated by a $\mathrm{C}_{18}$ column ( $\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}, 6: 4, \mathrm{v} / \mathrm{v}$ ) to afford conofoline ( 21 mg ) and conophylline ( 30 mg ). Fraction IIId ( 4 g ) was subjected to a $\mathrm{C}_{18}$ silica gel column and eluted with $\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}$ ( $7: 3, \mathrm{v} / \mathrm{v}$ ) to afford $4(18 \mathrm{mg})$ and fraction $\mathrm{C}(3 \mathrm{~g})$ as a mixture of compounds. C was further purified by Si gel CC (petroleum ether/ $\mathrm{Me}_{2} \mathrm{CO}, 5: 1 \mathrm{v} / \mathrm{v}$ ) to afford ervachinine A ( 6 mg ) and ervachinine B $(15 \mathrm{mg})$. Fraction IIIe ( 2.5 g ) was subjected to $\mathrm{C}_{18} \mathrm{Si}$ gel CC ( $\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}, 6: 4, \mathrm{v} / \mathrm{v}$ ) to yield $\mathbf{1}(21 \mathrm{mg})$ and mixed fraction D (19 $\mathrm{mg})$. D was purified by Sephadex LH-20 $(\mathrm{MeOH})$ to yield $2(10 \mathrm{mg})$. Fraction IV ( 11 g ) was separated by silica gel (petroleum ether/ acetone, from 5:1 to $1: 1, \mathrm{v} / \mathrm{v}$ ) to afford five subfractions (IVa-IVe). Fraction IVb ( 250 mg ) was further purified by Sephadex LH-20 $(\mathrm{MeOH})$ to yield conofoline ( 15 mg ) and 3-(2-oxopropyl)voacangine $(8 \mathrm{mg})$. Hydroxyindolenine ( 5 mg ) and picrinine ( 7 mg ) were crystallized from fraction IVd ( 46 mg ). Fraction IVe ( 3.2 g ) was subjected to $\mathrm{C}_{18} \mathrm{CC}\left(\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}\right.$, from $4: 6$ to $\left.9: 1, \mathrm{v} / \mathrm{v}\right)$ and then purified by Sephadex LH-20 ( MeOH ) to yield tabernanthine ( 14 mg ) and mixed fraction $\mathrm{E}(2.1 \mathrm{~g})$. E was further purified by a $\mathrm{C}_{18}$ column $\left(\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}, 5: 5, \mathrm{v} / \mathrm{v}\right)$ to afford (19S)-heyneanine ( 26 mg ) and 19,20-(E)-vallesamine ( 14 mg ).

Tabernaricatine A (1): colorless powder; $[\alpha]_{\mathrm{D}}^{25}-6.9$ (c 0.12 , $\mathrm{MeOH}) ; \mathrm{UV}(\mathrm{MeOH}) \lambda_{\max }(\log \varepsilon) 292$ (3.49), 285 (3.50), 222 (4.07) nm ; IR (KBr) $\nu_{\text {max }} 3388,2947,2927,2857,1728,1619,1461,1450$, 1281, 1240, 1129, 1056, 878, $740 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}(400 \mathrm{MHz})$ and ${ }^{13} \mathrm{C}$ NMR ( 150 MHz ) data (acetone- $d_{6}$ ), see Tables 1 and 2; positive ion HREIMS $m / z 748.3854$ (calcd for $\mathrm{C}_{44} \mathrm{H}_{52} \mathrm{~N}_{4} \mathrm{O}_{7}[\mathrm{M}]^{+\bullet}, 748.3831$ ).

Tabernaricatine $B$ (2): colorless powder; $[\alpha]_{D}^{25}+26.4$ (c 0.15, $\mathrm{MeOH})$; UV (MeOH) $\lambda_{\text {max }}(\log \varepsilon) 285(3.42)$, 222 (3.97) nm; IR (KBr) $\nu_{\text {max }} 3405,2956,2929,2870,2857,1727,1619,1461,1277$, 1243, 1117, 1072, $740 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}(600 \mathrm{MHz})$ and ${ }^{13} \mathrm{C}$ NMR ( 150 MHz ) data (acetone- $d_{6}$ ), see Tables 1 and 2; positive ion HREIMS $m /$ $z 734.3969$ (calcd for $\mathrm{C}_{43} \mathrm{H}_{54} \mathrm{~N}_{4} \mathrm{O}_{6}[\mathrm{M}]^{+\bullet}, 734.4038$ ).

Tabernaricatine C (3): light yellowish oil; $[\alpha]_{\mathrm{D}}^{25}-86.0$ (c 0.19 , $\mathrm{MeOH}) ; \mathrm{UV}(\mathrm{MeOH}) \lambda_{\text {max }}(\log \varepsilon) 295(3.53), 225(4.08) \mathrm{nm} ; \mathrm{IR}$ (KBr) $\nu_{\text {max }} 3424,2951,2928,2857,1723,1629,1462,1250,1039,742$ $\mathrm{cm}^{-1} ;{ }^{1} \mathrm{H}(500 \mathrm{MHz})$ and ${ }^{13} \mathrm{C}$ NMR ( 150 MHz ) data $\left(\mathrm{CDCl}_{3}\right)$, see Tables 1 and 2; positive ion HREIMS $m / z 732.3726$ (calcd for $\left.\mathrm{C}_{44} \mathrm{H}_{52} \mathrm{~N}_{4} \mathrm{O}_{6}[\mathrm{M}]^{+\bullet}, 732.3881\right)$.

Tabernaricatine $D$ (4): light yellowish oil; $[\alpha]_{\mathrm{D}}^{25}-28.5$ (c 0.08, $\mathrm{MeOH}) ; \mathrm{UV}(\mathrm{MeOH}) \lambda_{\text {max }}(\log \varepsilon) 285(2.83), 222(3.42) \mathrm{nm}$; IR $(\mathrm{KBr}) \nu_{\text {max }} 3433,2952,2925,2855,1725,1628,1461,1244,741 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}(400 \mathrm{MHz})$ and ${ }^{13} \mathrm{C}$ NMR ( 100 MHz ) data (acetone- $d_{6}$ ), see

Tables 1 and 2; positive ion HREIMS $m / z 732.3881$ (calcd for $\left.\mathrm{C}_{44} \mathrm{H}_{52} \mathrm{~N}_{4} \mathrm{O}_{6}[\mathrm{M}]^{+\bullet}, 732.3881\right)$.

Tabernaricatine E (5): light yellow powder; $[\alpha]_{\mathrm{D}}^{25}-11.0$ (c 0.10, $\mathrm{MeOH})$; UV $(\mathrm{MeOH}) \lambda_{\text {max }}(\log \varepsilon) 295$ (3.43), 227 (4.03) nm; IR (KBr) $\nu_{\max } 3440,2955,2924,2855,1725,1711,1630,1461,1248,744$ $\mathrm{cm}^{-1} ;{ }^{1} \mathrm{H}(400 \mathrm{MHz})$ and ${ }^{13} \mathrm{C}$ NMR ( 100 MHz ) data (acetone- $d_{6}$ ), see Tables 1 and 2; positive ion HREIMS $m / z 790.4297$ (calcd for $\left.\mathrm{C}_{47} \mathrm{H}_{58} \mathrm{~N}_{4} \mathrm{O}_{7}[\mathrm{M}]^{+\bullet}, 790.4300\right)$.

Tabernaricatine $F(6)$ : colorless powder; $[\alpha]_{\mathrm{D}}^{25}+78.2$ (c 0.5, $\mathrm{MeOH})$; UV $(\mathrm{MeOH}) \lambda_{\text {max }}(\log \varepsilon) 284$ (3.13), 223 (3.48) nm; IR $(\mathrm{KBr}) \nu_{\text {max }} 3430,2956,2930,2870,1714,1626,1474,1280,821 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}(600 \mathrm{MHz})$ and ${ }^{13} \mathrm{C}$ NMR ( 150 MHz ) data (acetone- $d_{6}$ ), see Table 3; positive ion HREIMS $m / z 382.2265$ (calcd for $\mathrm{C}_{23} \mathrm{H}_{30} \mathrm{~N}_{2} \mathrm{O}_{3}$ [M] ${ }^{+}$, 382.2251).

Tabernaricatine $G$ (7): colorless powder; $[\alpha]_{\mathrm{D}}^{25}-9.4$ (c 0.9 , $\mathrm{MeOH})$; UV $(\mathrm{MeOH}) \lambda_{\text {max }}(\log \varepsilon) 293$ (3.17), 226 (3.62) nm, 202 (3.65) nm; IR (KBr) $\nu_{\max } 3387,3295,2920,2872,1702,1490,1453$, 1280, $825 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}(400 \mathrm{MHz})$ and ${ }^{13} \mathrm{C}$ NMR ( 100 MHz ) data (acetone- $d_{6}$ ), see Table 3; positive ion HREIMS $m / z 366.2306$ (calcd for $\mathrm{C}_{23} \mathrm{H}_{30} \mathrm{~N}_{2} \mathrm{O}_{2}[\mathrm{M}]^{+\bullet}, 366.2302$ ).

Cytotoxicity Assay. Five human cancer cell lines, human myeloid leukemia (HL-60), hepatocellular carcinoma (SMMC-7721), lung cancer (A-549), breast cancer (MCF-7), and colon cancer (SW480), were used in the cytotoxic assay. All the cells were cultured in RPMI1640 or DMEM medium (Hyclone, USA), supplemented with $10 \%$ fetal bovine serum (Hyclone, USA), in $5 \% \mathrm{CO}_{2}$ at $37{ }^{\circ} \mathrm{C}$. The cytotoxicity assay was performed according to the MTT (3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyl tetrazolium bromide) method in 96 -well microplates. ${ }^{26}$ Briefly, $100 \mu \mathrm{~L}$ of adherent cells was seeded into each well of 96 -well cell culture plates and allowed to adhere for 12 h before drug addition, while suspended cells were seeded just before drug addition with an initial density of $1 \times 10^{5}$ cells $/ \mathrm{mL}$. Each tumor cell line was exposed to the test compound at concentrations of $0.0624,0.32,1.6,8$, and $40 \mu \mathrm{M}$ in triplicate for 48 h , with cisplatin (Sigma, USA) as a positive control. After compound treatment, cell viability was detected and a cell growth curve was graphed. $\mathrm{IC}_{50}$ values were calculated by Reed and Muench's method. ${ }^{27}$
