#### Abstract

Three novel asymmetric ent-kaurane dimers xindongnins M-O (1-3) were isolated from Isodon rubescens var. rubescens. Their structures were elucidated by spectroscopic methods including 2D NMR analysis. The relative stereochemistry of $\mathbf{1}$ was determined by single crystal X-ray diffraction, which also confirmed the unique linkage of a single carbon-carbon bond between the two subunits of this dimer. A biogenetic pathway was proposed for the formation of these dimers. © 2004 Elsevier Ltd. All rights reserved.

In our continuing phytochemical investigation of Isodon rubescens complex, ${ }^{\text {1a-f }}$ we examined, with the aid of analytical and preparative HPLC, the aqueous acetone extract of the leaves of I. rubescens var. rubescens collected in Shangcheng Prefecture, Henan Province of China, ${ }^{2}$ as a result, three novel asymmetric ent-kaurane dimers were isolated, together with two known compounds melissoidesin $G(4)^{3}$ and xingdongnin $A(5) .{ }^{4}$ The structures of these dimers were elucidated by the analysis of their HRMS and NMR data, especially 2D NMR spectra. These were the first examples of entkaurane dimers that possessed a rare linkage of a single carbon-carbon bond between the two structural subunits. This unique linkage was finally confirmed by single crystal X-ray analysis.

Xindongnin M(1) was obtained as colorless cubes. Its molecular formula was determined to be $\mathrm{C}_{48} \mathrm{H}_{70} \mathrm{O}_{15}$ by positive HRFABMS (found 887.4793, calcd 887.4811 for $\mathrm{C}_{48} \mathrm{H}_{71} \mathrm{O}_{15}$ ). ${ }^{5}$ Its ${ }^{13} \mathrm{C}$ NMR spectrum (Table 1) confirmed this formula, and exhibited carbon signals of two diterpene units ( $\mathbf{1 a}$ and $\mathbf{1 b}$ ) bearing four acetoxy groups in total. Each of the units was further indicated to have a kaurane skeleton by the characteristic signals of three methyl groups (C-18, 19, and 20), three methine carbons (C-5, 9, and 13), and three quaternary carbons

Figure 1. Selected HMBC and ROESY correlations of 1.
(C-4, 8, and 10). Considering that all the kauranoids isolated from the genus Isodon possessed an ent-configuration, the two units ( $\mathbf{1 a}$ and $\mathbf{1 b}$ ) were presumed to also be ent-kauranes. A comparison of their NMR data with those of melissoidesin $G(4$, a known ent-kauranoid also isolated from this fraction) revealed that both $\mathbf{1 a}$ and $\mathbf{1 b}$ were very similar to 4 except at $\mathrm{C}-16$ and $\mathrm{C}-17$. The olefinic quaternary carbon ( $\mathrm{C}-16$ ) of 4 corresponded to an oxygenated quaternary carbon ( $\delta 0.6$ ) in 1a and a methine carbon ( $\delta 57.3$ ) in 1b, respectively, while the olefinic methylene carbon ( $\mathrm{C}-17$ ) of 4 was replaced by two methylene carbons ( $\delta 30.7$ and 20.8) in $\mathbf{1 a}$ and $\mathbf{1 b}$. More importantly, the protons of these two methylene groups ( $\delta 3.17$ and $2.39 ; \delta 2.97$ and 2.66 ) showed ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY correlations with each other, indicating a single bond between these two carbons belonging to $\mathbf{1 a}$ and $\mathbf{1 b}$. This was supported by a series of HMBC correlations between $\mathrm{H}_{2}-17$ with $\mathrm{C}-13,15,16$, and $16^{\prime}$ and $\mathrm{H}_{2}-17^{\prime}$ with $\mathrm{C}-13^{\prime}, 15^{\prime}, 16^{\prime}$, and 16 (Fig. 1).

The substituents were accordingly assigned as $3 \beta-\mathrm{OAc}$, $6 \alpha-\mathrm{OAc}, 7 \beta-\mathrm{OH}, 11 \beta-\mathrm{OH}, 3^{\prime} \beta-\mathrm{OAc}, 6^{\prime} \alpha-\mathrm{OAc}, 7^{\prime} \beta-\mathrm{OH}$, and $11^{\prime} \beta-\mathrm{OH}$, respectively, by the HMBC and ROESY correlations as shown in Figure 1. The OH-16 was suggested to be in an $\alpha$-orientation by the significant upfield signal of C-12 ( $\delta 32.5$ ) compared to that in 4, which was caused by the $\gamma$-steric compression effect between $16 \beta$-methylene group with $\mathrm{H}-12 \beta$. ${ }^{\text {a }}$ Similarly, the $\beta$-orientation was deduced for $16^{\prime}$-methylene group. Finally, the structure of this diterpene dimer (1) was established as presented in Figure 1, which was confirmed by single crystal X-ray diffraction (Fig. 2). ${ }^{6}$

The positive HRFABMS and ${ }^{13} \mathrm{C}$ NMR data (Table 1) revealed xindongnin $N$ (2) to be an analogue of $\mathbf{1}$, a diterpene dimer having the molecular formula $\mathrm{C}_{48} \mathrm{H}_{68} \mathrm{O}_{15} .{ }^{5}$ It was suggested to possess a similar linkage between its two subunits, a single carbon-carbon bond
on the basis of the characteristic ${ }^{13} \mathrm{C}$ NMR signals: an oxygenated quaternary carbon ( $\delta 80.5$, due to $\mathrm{C}-16$ ), two methylene carbons ( $\delta 30.5$ and 20.5, C-17 and C-17') and a methine carbon ( $\delta 57.1, \mathrm{C}-16^{\prime}$ ). In contrast to $\mathbf{1}$, xindongnin N (2) was constructed from two different diterpenes units ( $\mathbf{2 a}$ and $\mathbf{2 b}$ ). 2a Is similar to $\mathbf{4}$, while $\mathbf{2 b}$ resembled xindongnin $A$ (5). The assignment of the oxygenated quaternary carbon (or the methylene carbon at $\delta 30.5$ ) was the key to the structural elucidation of 2. Detailed analysis of the COSY, HMQC, and HMBC spectra of 2 disclosed that the protons ( $\delta 3.05$ and 2.26) of the methylene group ( $\delta 30.5, \mathrm{C}-17$ ) exhibited HMBCs with both the oxygenated quaternary carbon (80.5) and a carbonyl carbon ( $\delta 225.7$ ). And this carbonyl carbon was further indicated to be C-15 of 2a by the HMBC correlation between the characteristic H-7 ( $\delta 4.31$ ) of 2a with this carbon. Therefore, the oxygenated quaternary carbon ( $\delta 80.5$ ) should be assigned to C-16 of $\mathbf{2 a}$, and the structure of 2 was established to be as shown. In the same way, xindongnin $O$ (3) was elucidated to be an isomer of 2 , in whose structure the oxygenated quaternary carbon ( $\delta 80.6$ ) was indicated to be C-16 of the unit similar to xindongnin A (5). According to these dimers' structures, all the NMR data of 2 and $\mathbf{3}$ were successfully assigned with the aid of their 2D NMR spectra.

The biotransformation of this kind of dimers from normal ent-kauranoids isolated from the genus Isodon, was proposed to be as shown in Scheme 1. These entkauranoids normally had the $\alpha, \beta$-unsaturated ketone groups. The $[4+2]$ cycloaddition, between the $\alpha, \beta$ unsaturated ketone group of one diterpene unit with the olefin group of a second unit, yielded a six-membered heterocycle, ${ }^{7}$ which linked the monomers together. The hydrolysis and rearrangement at this heterocycle then produced the title dimers. We note that this $[4+2]$ cycloaddition needs rigorous conditions in organic synthesis, which are impossible in plants. It is possible

Figure 2. Crystal structure of compound 1.

Scheme 1. Proposed biogenesis of 1-3.
that in the Isodon plants there may be a bio-enzyme that catalyzes this reaction.

Compound 3: white amorphous powder; $[\alpha]_{\mathrm{D}}^{22.0}-15.4$ $(\mathrm{MeOH}, ~ с ~ 0.20) ~ p o s i t i v e ~ F A B M S ~ m / z: ~ 885 ~[M+H]^{+}$; positive HRFABMS $m / z:[\mathrm{M}+\mathrm{H}]^{+} 885.4635$ (calcd for $\mathrm{C}_{48} \mathrm{H}_{69} \mathrm{O}_{15}$ 885.4636); IR (KBr) $v_{\text {max }}: 3446$, 2939, 1736, 1636, 1435, 1375, 1243, $1034 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $\mathrm{C}_{5} \mathrm{D}_{5} \mathrm{~N}$, $500 \mathrm{MHz})$ and ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{C}_{5} \mathrm{D}_{5} \mathrm{~N}, 125 \mathrm{MHz}\right)$ : see Table 1.
6. Crystal data for $\mathbf{1}$. Crystals of $\mathbf{1}$, crystallized from acetone, belong to the monoclinic space group $P 2_{1}$. Crystal data: $\mathrm{C}_{48} \mathrm{H}_{70} \mathrm{O}_{15} \cdot\left(\mathrm{CH}_{3} \mathrm{OH}\right)_{2} \cdot\left(\mathrm{H}_{2} \mathrm{O}\right)_{0.5}, \quad M=887.07, \quad a=12.826$ (1), $b=16.859(1), c=12.872(1) \mathrm{A}, \beta=104.56(1)^{\circ}, \quad V=$
2694.0(3) $\AA^{3}, \quad Z=2, \quad d=1.182 \mathrm{~g} / \mathrm{cm}^{3}, \quad$ Mo $\mathrm{K} \alpha$ radiation, linear absorption coefficient $\mu=1.0 \mathrm{~cm}^{-1}$. A colorless cube of dimensions $0.20 \times 0.20 \times 0.50 \mathrm{~mm}$ was used for X-ray measurements on a MAC DIP-2030K diffractometer with a graphite monochromator, maximum $2 \theta$ value of $50.0^{\circ}$ was set. The total number of independent reflections measured was 4286,4253 of which were considered to be observed $\left(|F|^{2} \geqslant 3 \sigma|F|^{2}\right)$. The structure was solved by the direct method SHELXS-86 and expanded using difference Fourier techniques, refined by the program and method NOMCSDP ${ }^{8}$ and full-matrix least-squares calculations. Hydrogen atoms were fixed at calculated positions. The final indices were $R_{\mathrm{f}}=0.084, R_{\mathrm{w}}=0.086\left(w=1 / \sigma|F|^{2}\right), S_{=}=$ 4.542, $\quad(\Delta / \rho)_{\max }=0.135, \quad(\Delta / \rho)_{\min }=-0.520 \quad \mathrm{e} / \mathrm{A}^{3}$, $(\Delta / \rho)_{\max }=0.310 \mathrm{e} / \mathrm{A}^{3}$. The crystal structure of $\mathbf{1}$ has been deposited at the Cambridge Crystallographic Data Centre and allocated the deposition number CCDC 226868.
