#### Abstract

A number of the indole-containing chiral oxazolidines possessing the gem-di-p-tolyl and gem-di-o-tolyl groups at $\mathrm{C}_{5}$ were synthesized from abrine and the effects of the $\mathrm{C}_{5}$ and $\mathrm{C}_{2}$ substituents on the asymmetric induction in catalytic enantioselective addition of diethylzinc to benzaldehyde were examined. A working model is proposed to rationalize the asymmetric catalysis by these chiral oxazolidines. © 1998 Elsevier Science Ltd. All rights reserved.

## 1. Introduction

Enantioselective addition of dialkylzinc to aldehydes catalyzed by chiral $\beta$-amino alcohols ${ }^{1}$ and other chiral promoters is one of the most extensively investigated asymmetric $\mathrm{C}-\mathrm{C}$ bond formation reactions in recent years. Extension of this catalytic enantioselective reaction to ketones ${ }^{2}$ and $\mathrm{C}=\mathrm{N}^{3}$ functionalities further widens its application to the synthesis of chiral alcohols possessing a stereogenic quaternary carbon center and chiral amines. Our recent work on the alkaloid-based asymmetric synthesis has produced several novel classes of chiral promoters containing an indole moiety. ${ }^{4}$ We found that the chiral oxazolidines $\mathbf{1 a} \mathbf{-} \mathbf{j}$ and related compounds, although lacking a hydroxyl group, could catalyze the reaction of $\mathrm{Et}_{2} \mathrm{Zn}$ with benzaldehyde in up to $53.8 \%$ ee. ${ }^{4 \mathrm{~b}}$ We describe herein the synthesis and catalysis of chiral oxazolidines $\mathbf{2 a - g}$ having the gem-di-o-tolyl groups at $\mathrm{C}_{5}$ and propose a working model to discuss the substituent effect on the catalysis of chiral oxazolidines 1a-j and $\mathbf{2 a - g}$ (Fig. 1).

## 2. Results and discussion

Chiral oxazolidines $\mathbf{1}^{4 \mathrm{~b}}$ and $\mathbf{2}$ were synthesized from the alkaloid, abrine $[(S) \text { - } N \text {-methyltryptophan }]^{5}$ isolated from the seeds of Abrus precatorius collected in the Yunnan Province of China (Scheme 1). Reaction of the methyl ester of abrine with excess $p$ - or $o-\mathrm{TolMgBr}$ afforded the corresponding tertiary $\beta$-amino alcohols $\mathbf{3 a}$ and $\mathbf{3} \mathbf{b}^{4 \mathrm{a}}$ which were condensed with a number of aldehydes in the presence of 4 $\AA$ MS under very mild conditions $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$, rt or PhH , refluxing) to provide chiral cis-2,4-disubstituted oxazolidines 1a-j and $\mathbf{2 a - g}$ in 59-89\% yield (Table 1). The trans-isomers of the oxazolidines were not detected from the condensation reaction in most cases.

${ }^{\text {a D Data taken from ref. 4b. }}{ }^{\text {b }}$ Yield is based on the isolated product. Benzyl alcohol was formed in most of the reactions. ${ }^{\text {c }}$ Determined using HPLC on a CHIRALCEL OD column ( $i$ - PrOH :Hexane $=95: 5$, flow rate $=1 \mathrm{~mL} / \mathrm{min}$, UV detector at 254 nm ). ${ }^{\text {d }}$ The specific rotation $[\alpha]_{\mathrm{D}}+45.6^{\circ}\left(\mathrm{CHCl}_{3}\right)^{6}$ for $R$ enantiomer of 4 was used to determine the configuration. ${ }^{\text {e }}$ The values were reexamined. ${ }^{\dagger}$ Reaction for 6 days.

The catalytic potency of $\mathbf{1 a - j}$ and $\mathbf{2 a - g}$ was examined using the prototype reaction between $\mathrm{Et}_{2} \mathrm{Zn}$ and benzaldehyde with $10 \mathrm{~mol} \%$ of the catalyst in toluene at room temperature and the results are summarized in Table 2. It is interesting to note that the catalysts 1 induced the formation of the $(S)$ enantiomer of 1-phenyl-1-propanol (-)-4 in up to $53.8 \%$ ee and in $34.2-57.8 \%$ yield except for chiral oxazolidine $1 f$ bearing an isopropyl group at the $\mathrm{C}_{2}$ position. In contrast, only the $(R)$-enantiomer of 1-phenyl-1-propanol (+)-4 ${ }^{6}$ was formed in up to $22.6 \%$ ee and in $34-69 \%$ yield under the catalysis of chiral oxazolidines $\mathbf{2 a - g}$. The opposite asymmetric induction by $\mathbf{1 a - e}, \mathbf{g}-\mathbf{j}$ and $\mathbf{2 a - g}$ is influenced by the gem-diaryl groups at $\mathrm{C}_{5}$. The enantioselectivity is generally high for $\mathrm{C}_{5}$ gem-di-p-tolyl-substituted oxazolidines $\mathbf{1}$ compared with the $\mathrm{C}_{5}$ gem-di-o-tolyl-substituted analogs $\mathbf{2}$. A plot of the percentage ee versus the carbon number of the substituent $R$ at $C_{2}$ of $\mathbf{1 a - e}$ and $\mathbf{2 a - e}$ is given in Fig. 2. It is concluded that: (a) the enantiomeric excess varies with the carbon number of R at $\mathrm{C}_{2}$ with a maximum value recorded for $\mathrm{R}=n$ - Pr for both classes of chiral oxazolidines; and (b) the enantioselectivity of the reaction is much more sensitive to the $\mathrm{C}_{2} \mathrm{R}$ group for the catalysts $\mathbf{1 a} \mathbf{a} \mathbf{e}$ compared with that of $\mathbf{2 a -} \mathbf{e}$, indicating that the $\mathrm{C}_{2} \mathrm{R}$ group in $\mathbf{1 a - e}$ is in close proximity to the reacting centers in the ethyl-transferring transition state. In other words, a loose transition state operates in the reactions catalyzed by chiral oxazolidines 2a-e and low asymmetric induction is achieved.

Generally speaking, the enantioselectivity induced by chiral oxazolidines $\mathbf{1}$ and $\mathbf{2}$ is not very high compared with a variety of hydroxyl group bearing chiral promoters. ${ }^{1}$ However, the current work is interesting in the mechanistic aspects of the catalysis. It was reported that chiral diamines ${ }^{7-9}$ including

Fig. 2. Relationship between the ees of chiral 1-phenyl-1-propanol (4) and the carbon number of R at the $\mathrm{C}_{2}$ position of chiral oxazolidine promotors $\mathbf{1}$ and $\mathbf{2}$ used for enantioselective ethylation of benzaldehyde
tertiary diamines catalyze the addition reactions of $\mathrm{Et}_{2} \mathrm{Zn}$ to aldehydes by formation of either the $\mathrm{N}-\mathrm{Zn}$ complexes or zinc amides. ${ }^{8 \mathrm{~b}, \mathrm{c} 10,11}$ The methoxy group in $o$-anisaldehyde was also reported to form undesirable catalytic species by coordination with $\mathrm{Et}_{2} \mathrm{Zn}$. ${ }^{9 \mathrm{a}}$ The chiral oxazolidines $\mathbf{1 a} \mathbf{a} \mathbf{j}$ and $\mathbf{2 a - g}$ have two basic sites, i.e. the nitrogen and oxygen atoms of the oxazolidine ring. If the indole nitrogen could be deprotonated by $\mathrm{Et}_{2} \mathrm{Zn}$, a third basic site might be available for complexation. Nevertheless, we consider that the nitrogen and oxygen atoms of the oxazolidines contribute primarily to the catalysis through the transition state (TS) 5 (Fig. 3). The oxygen-bound zinc species $\left[\left(\mathrm{E}_{\mathrm{b}}\right)_{2} \mathrm{Zn}_{\mathrm{b}}\right]$ is much more reactive ${ }^{9 \mathrm{a}}$ and will transfer the $\mathrm{Et}_{\mathrm{b}}$ group onto the $\mathrm{C}=\mathrm{O}$ of benzaldehyde complexed with $\mathrm{Zn}_{\mathrm{a}}$, the latter is also coordinated with the nitrogen atom. An alternative to TS 5 is considered by sharing one $\mathrm{Et}_{\mathrm{a}}$ group on $\mathrm{Zn}_{\mathrm{a}}$ with $\mathrm{Zn}_{\mathrm{b}}$ to form a polycyclic assembly (a bridged 5/6/6-ring system) which is likely to be too rigid to work. TS 5 predicts the si-face attack at benzaldehyde to give ( $S$ )-4 as the major enantiomer which is consistent with our experimental results of $\mathbf{1 a - e} .{ }^{4 \mathrm{~b}}$ Modification on the gem-diaryl groups at $\mathrm{C}_{5}$ can significantly affect the complexation ability of the oxygen atom. With two bulky o-tolyl groups at $\mathrm{C}_{5}$, TS 5 fails to operate because the oxygen atom is incapable of forming a complex due to the severe steric repulsion. Under this circumstance, the Et-transferring zinc species should attack intermolecularly by another zinc complex of the oxazolidine nitrogen or a zinc amide of the indole ${ }^{8 b, c, 10,12}$ at the $\mathrm{Zn}_{\mathrm{a}}$ coordinated benzaldehyde from the re-face (TS 6) to give $(R)-4$. Due to the great separation among the reacting and the $\mathrm{C}_{2} / \mathrm{C}_{4}$ stereogenic centers, the asymmetric induction of $\mathbf{2 a - g}$ should be low and less sensitive to the R group at $\mathrm{C}_{2}$.

In summary, we have examined a number of chiral oxazolidines $\mathbf{1 a}-\mathbf{j}$ and $\mathbf{2 a - g}$ possessing an indole moiety as promoters in the enantioselective addition of $\mathrm{Et}_{2} \mathrm{Zn}$ to benzaldehyde and found that substituents on both $\mathrm{C}_{2}$ and $\mathrm{C}_{5}$ positions of the oxazolidine ring significantly influence the asymmetric induction. Based on these results, we propose a transition state $\mathbf{5}$ for catalysis by $\mathbf{1 a - e}, \mathbf{g}-\mathbf{i}$, featuring the coordination of both oxygen and nitrogen atoms of the oxazolidine with the zinc species. Our finding will encourage further study on the use of readily available chiral oxazolidines ${ }^{10}$ in asymmetric catalysis.

## 3. Experimental section

${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Bruker ARX 300 or AM-400 NMR instrument. IR spectra were taken on a Bio-Rad FTS-IR spectrophotometer. Mass spectra (MS) were measured on a Finnigan TSQ 7000 mass spectrometer. High resolution mass spectra (HRMS) were measured by a VG Autospec mass spectrometer under $\mathrm{FAB}^{+}$conditions. Elemental analysis was performed on a Model 1106 instrument. Optical rotations were recorded on a Perkin-Elmer 241 polarimeter. All reactions were

carried out under a nitrogen atmosphere and monitored by thin-layer chromatography on 0.25 mm E. Merck silica gel plates ( 60 F-254) using UV light, or $7 \%$ ethanolic phosphomolybdic acid and heating as the visualizing methods. E. Merck silica gel 60 (particle size $0.040-0.063 \mathrm{~mm}$ ) was used for flash column chromatography. Yields refer to chromatographically and spectroscopically ( ${ }^{1} \mathrm{H}$ NMR) homogeneous materials. Abrine was isolated from the extract of the seeds of Abrus precatorius collected in the Yunnan Province of China. ${ }^{5}$ Amino alcohols 3a and 3b were synthesized from abrine according to the known procedure. ${ }^{4 \mathrm{a}} \mathrm{Et}_{2} \mathrm{Zn}(1.0 \mathrm{M}$ in hexanes) and other reagents were obtained commercially and used as received.

### 3.1. Oxazolidines $\mathbf{1 a - j}$ and $\mathbf{2 a - g}$; general procedure

Method A: A solution of $\mathbf{3 a}(128 \mathrm{mg}, 0.33 \mathrm{mmol})$ and the aldehyde $(0.50 \mathrm{mmol})$ in dry $\mathrm{PhH}(10 \mathrm{~mL})$ in the presence of powdered $4 \AA \mathrm{MS}$ was heated at refluxing temperature until the TLC analysis indicated the completion of the reaction (see Table 1 for reaction times).

Method B: A solution of $\mathbf{3 a}$ or $\mathbf{3 b}(128 \mathrm{mg}, 0.33 \mathrm{mmol})$ and the aldehyde $(0.50 \mathrm{mmol})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ $(10 \mathrm{~mL})$ in the presence of powdered $4 \AA \mathrm{MS}$ was stirred at room temperature until TLC analysis indicated the completion of the reaction (see Table 1 for reaction times). The reaction mixture was filtered through a pad of Celite with washing by diethyl ether. The combined organic solution was evaporated under reduced pressure. The residue was purified by flash column chromatography (silica gel, $14 \%$ EtOAc in hexane) to give the oxazolidines. The yields and specific rotation data are summarized in Table 1.

### 3.1.14. (2S,4S)-2-Butyl-4-(indol-3-yl-methyl)-3-methyl-5,5-di(0-tolyl)-1,3-oxazolidine 2d

Pale yellow foam; IR (KBr) 3226, 2954, 2928, 1458, 1353, 1234, 1131, 1017, 754, $739 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.88(\mathrm{~s}, 1 \mathrm{H}), 7.59(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.52(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.33(\mathrm{~d}, J=8.0$ $\mathrm{Hz}, 1 \mathrm{H}), 7.21-7.00(\mathrm{~m}, 9 \mathrm{H}), 6.83(\mathrm{~s}, 1 \mathrm{H}), 4.31(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.65(\mathrm{dd}, J=6.0,2.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.34$ (dd, $J=11.8,8.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.20(\mathrm{~d}, J=11.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.16(\mathrm{~s}, 6 \mathrm{H}), 2.04(\mathrm{~s}, 3 \mathrm{H}), 2.03-1.32(\mathrm{~m}, 6 \mathrm{H}), 0.95(\mathrm{t}$, $J=7.1 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 140.3,139.1,136.3,133.3,131.6,128.4,127.7,127.2$, $125.1,123.9,121.6,119.2,118.4,111.2,94.0,90.1,67.5,38.9,33.5,27.1,22.8,22.5,21.6,14.1$; HRMS $\left(\mathrm{FAB}^{+}\right)$calcd for $\mathrm{C}_{31} \mathrm{H}_{37} \mathrm{~N}_{2} \mathrm{O}\left(\mathrm{M}^{+}+1\right)$ : 453.2906. Found: 453.2885.

### 3.1.15. (2S,4S)-4-(Indol-3-yl-methyl)-3-methyl-2-pentyl-5,5-di(o-tolyl)-1,3-oxazolidine $2 \boldsymbol{e}$

Pale yellow foam; $\operatorname{IR}(\mathrm{KBr}) 3221,2953,2928,1458,1353,1129,1017,754,734 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.88(\mathrm{~s}, 1 \mathrm{H}), 7.59(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.52(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.33(\mathrm{~d}, J=8.0 \mathrm{~Hz}$, $1 \mathrm{H}), 7.21-7.00(\mathrm{~m}, 9 \mathrm{H}), 6.83(\mathrm{~s}, 1 \mathrm{H}), 4.31(\mathrm{~d}, J=8.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.65(\mathrm{dd}, J=6.0,2.9 \mathrm{~Hz}, 1 \mathrm{H}), 2.34(\mathrm{dd}$, $J=11.8,8.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.20(\mathrm{~d}, J=11.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.16(\mathrm{~s}, 6 \mathrm{H}), 2.04(\mathrm{~s}, 3 \mathrm{H}), 2.03-1.32(\mathrm{~m}, 8 \mathrm{H}), 0.90(\mathrm{t}, J=7.1$ $\mathrm{Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 141.0,139.1,136.3,135.0,133.1,131.4,129.0,128.4,127.7$, $127.4,126.7,124.9,123.7,122.9,121.5,119.0,118.9,114.3,111.0,93.8,89.8,66.9,38.9,34.4,31.2$, 24.4, 23.0, 22.3, 21.7, 14.2; HRMS $\left(\mathrm{FAB}^{+}\right)$calcd for $\mathrm{C}_{32} \mathrm{H}_{39} \mathrm{~N}_{2} \mathrm{O}\left(\mathrm{M}^{+}+1\right)$ : 467.3062. Found: 467.3066.

### 3.1.16. (2S,4S)-4-(Indol-3-yl-methyl)-2-isopropyl-3-methyl-5,5-di(o-tolyl)-1,3-oxazolidine $2 f$

Pale yellow foam; IR (KBr) 3417, 3392, 2960, 2927, 1456, 1357, 1230, 1054, 1023, $746 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.93(\mathrm{~s}, 1 \mathrm{H}), 7.57(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.34(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.30-7.00(\mathrm{~m}$, $9 \mathrm{H}), 6.95(\mathrm{~s}, 1 \mathrm{H}), 4.42(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 3.51(\mathrm{~d}, J=3.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.44(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 2.19(\mathrm{~d}, J=13.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.13$ (s, 3H), $2.06(\mathrm{~s}, 6 \mathrm{H}), 2.00-1.80(\mathrm{~m}, 1 \mathrm{H}), 1.16(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 3 \mathrm{H}), 1.04(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 100 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 140.9,139.2,136.3,134.6,133.2,131.4,129.1,128.2,127.8,127.5,127.0,125.0,123.7$, $123.2,121.5,119.1,118.6,114.1,111.1,98.0,89.4,66.8,40.2,31.7,30.8,29.7,22.3,21.5,18.7$; HRMS $\left(\mathrm{FAB}^{+}\right)$calcd for $\mathrm{C}_{30} \mathrm{H}_{35} \mathrm{~N}_{2} \mathrm{O}\left(\mathrm{M}^{+}+1\right)$ : 439.2749. Found: 439.2685.

### 3.1.17. (2S,4S)-4-(Indol-3-yl-methyl)-3-methyl-2-(2-methylpropyl)-5,5-di(o-tolyl)-1,3-oxazolidine $2 g$

Pale yellow foam; IR (KBr) 3428, 2954, 2928, 1456, 1355, 1232, 1014, $745 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( 400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.92(\mathrm{~s}, 1 \mathrm{H}), 7.59(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.51(\mathrm{~d}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.32(\mathrm{~d}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H})$, $7.25-7.00(\mathrm{~m}, 9 \mathrm{H}), 6.87$ (br s, 1H), 4.44 (br s, 1H), 3.70 (d, $J=7.3 \mathrm{~Hz}, 1 \mathrm{H}$ ), 2.40 (br s, 1H), 2.25 (d, $J=13.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.11(\mathrm{~s}, 3 \mathrm{H}), 2.04(\mathrm{~s}, 6 \mathrm{H}), 2.00-1.50(\mathrm{~m}, 3 \mathrm{H}), 1.01(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 3 \mathrm{H}), 0.86(\mathrm{~d}, J=6.5$ $\mathrm{Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 140.5,139.0,136.3,133.2,131.5,128.8,128.5,127.5,127.0$, $125.0,123.8,123.3,121.6,119.1,118.7,111.0,92.9,90.0,67.0,43.9,38.8,29.7,25.1,23.7,22.7,22.4$, 21.6; HRMS $\left(\mathrm{FAB}^{+}\right)$calcd for $\mathrm{C}_{31} \mathrm{H}_{37} \mathrm{~N}_{2} \mathrm{O}\left(\mathrm{M}^{+}+1\right)$ : 453.2906. Found: 453.2948.

### 3.2. A typical procedure for the catalytic addition of $E t_{2} \mathrm{Zn}$ to bezaldehyde

To a solution of the chiral oxazolidine $\mathbf{1}$ or $2(0.18 \mathrm{mmol})$ in dry $\mathrm{PhMe}(8 \mathrm{~mL})$ under a nitrogen atmosphere cooled in an ice-water bath (ca. $0^{\circ} \mathrm{C}$ ) was added a solution of $\mathrm{Et}_{2} \mathrm{Zn}(4 \mathrm{~mL}, 1 \mathrm{M}$ in hexanes) via a syringe. After stirring for 10 min , freshly distilled benzaldehyde $(0.20 \mathrm{~mL}, 1.80 \mathrm{mmol})$ was added into the mixture via another syringe. The resultant mixture was allowed to warm up to room temperature and stirring was continued for $94-100 \mathrm{~h}$. The reaction mixture was cooled in an ice-water bath and quenched with $5 \% \mathrm{HCl}$ aqueous solution. The mixture was extracted with diethyl ether ( $3 \times 20 \mathrm{~mL}$ ), washed with brine, dried over anhydrous $\mathrm{MgSO}_{4}$, and condensed under reduced pressure. The residue was purified by flash column chromatography (silica gel, $10 \% \mathrm{EtOAc}$ in hexane) to give chiral 1-phenyl-1-propanol (4). The yields and enantiomeric excess data are summarized in Table 2.
