#### Abstract

A number of chiral $\beta$-amino alcohols possessing a 3-indolylmethyl group have been synthesized from the alkaloid ( $S$ )-abrine and elucidated for potency in the catalytic enantioselective ethylation of PhCHO with $\mathrm{Et}_{2} \mathrm{Zn}$. In general, the secondary amines $\mathbf{1 5 a}$-d bearing a dialkylhydroxymethyl group induced $(R)-1-$ phenyl-1-propanol, whereas $15 \mathrm{e}-\mathrm{g}$ and $\mathbf{1 8}$ bearing a diarylhydroxymethyl group favored the ( $S$ )-enantiomer. In contrast, the $\beta$-tertiary amino alcohols 20b-d and 21 produced ( $R$ )-1-phenyl-1-propanol, regardless of the substituents at the carbon bearing the hydroxy group. Enantiomeric excess of $87.5 \%$ was obtained for ( $R$ )-1-phenyl-1-propanol using ligand 21 as the promoter. Eleven substituted benzaldehydes and naphthaldehydes were examined for enantioselective ethylation by using 21 and the chiral alcohols were obtained in $93-97 \%$ ee, except for $o-\mathrm{BrC}_{6} \mathrm{H}_{4} \mathrm{CHO}$ and $p-\mathrm{Me}_{2} \mathrm{NC}_{6} \mathrm{H}_{4} \mathrm{CHO}$. Excellent enantioselectivity was also observed in the ethylation of cyclohexanecarboxaldehyde ( $94.8 \%$ ee) and 2-thiophenecarboxaldehyde ( $94.9 \%$ ee) by using catalytic 21. The anti $5 / 4 / 4-$ fused tricyclic TS I was proposed to rationalize the asymmetric induction. The diethylhydroxymethyl and $N-2-t$-butylethyl groups are believed to enforce the preference for the $\operatorname{anti}-\mathrm{TS}(R)$ I and it results in high enantioselectivity. © 2000 Elsevier Science Ltd. ## 1. Introduction

The organic molecules isolated from the extracts of plants have been extremely valuable to humans in curing diseases such as cancer. ${ }^{1,2}$ Because the molecules produced through plant biosynthesis are commonly homochiral, natural products are also the most important source of the homochiral ligands and auxiliaries used in contemporary asymmetric synthesis. ${ }^{3}$ A well-known

[^0]example is the use of the alkaloids, dihydroquinidine and dihydroquinine, and their derivatives in the catalytic asymmetric dihydroxylation. ${ }^{4}$ Recently, we were able to isolate the alkaloid, $(S)$ abrine $\mathbf{1 b},{ }^{5}$ the $N$-methylated $\alpha$-amino acid of ( $S$ )-tryptophan 1a in multi-gram quantity from the red beans (Rosary pea or Xiang Si Zi in Chinese) of Abrus precatorius L., which were collected in the Yunnan Province located in the southwestern part of China. We were particularly interested in exploring the application of $(S)$-abrine in catalytic enantioselective reactions by taking advantage of the indole moiety and the $N$-methyl group. After searching the literature, we found only a small number of precedents in utilizing ( $S$ )-tryptophan derivatives as the chiral ligands in catalytic enantioselective reactions (Fig. 1). The Zn (II) complex formed from ( $S$ )-tryptophan ethyl ester and $\mathrm{Zn}\left(\mathrm{NO}_{3}\right)_{2} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ was used to catalyze the asymmetric aldol reaction. ${ }^{6 a}$ Inoue and co-workers reported that the chiral $\mathrm{Ti}(\mathrm{IV})$ species derived from the dipeptide 2 and $\mathrm{Ti}(\mathrm{Oi}-\mathrm{Pr})_{4}$ promoted the addition of HCN to aldehydes in up to $90 \%$ ee. ${ }^{6 \mathrm{~b}}$ A number of chiral oxazaborolidines obtained from $N$-tosyl-( $(S)$-tryptophan 3a and $N$-tosyl- $(\alpha S, \beta R)-\beta$-methyltryptophan 3b and boron compounds were demonstrated to be excellent catalysts for asymmetric Diels-Alder reaction. ${ }^{6 c-e}$ Various 2-substituted 2,3-dihydro- $4 H$-pyran-4-ones were prepared in $67-82 \%$ ee via the aldol reaction catalyzed by the chiral oxazaborolidine of 3 a followed by treatment with $\mathrm{CF}_{3} \mathrm{CO}_{2} \mathrm{H}$. ${ }^{6 f}$ The chiral oxazaborolidine formed from $\mathbf{3 b}$ and ( $p$-chlorophenyl)dibromoborane catalyzed the enantioselective ring cleavage of 1,3-dioxolanes with enol silyl ethers in $86-93 \%$ ee. ${ }^{6 \mathrm{~g}}$ Very recently, Engberts and co-workers reported the (S)-abrine- $\mathrm{Cu}(\mathrm{II})$ complex that catalyzed the Diels-Alder reaction of 3-phenyl-1-(2-pyridyl)-2-propen-1-one with cyclopentadiene in $74 \%$ ee. ${ }^{7}$ It was suggested that both the 3 -indolylmethyl and the $N$-methyl groups in ( $S$ )-abrine are important for stereochemistry control in the transition state. ${ }^{7}$

Figure 1. Chiral indole-containing ligands used in catalytic enantioselective reactions
Enantioselective addition of dialkylzincs to aldehydes in the presence of a chiral promoter, such as chiral $\beta$-amino alcohols, has been shown to be an attractive and synthetically useful carboncarbon bond-forming reaction. ${ }^{8}$ A vast number of chiral promoters including $\beta$-amino alcohols, $\beta$-amino thiols, diamines, and diols has been accumulated since the first report by Oguni and Omi in 1984, ${ }^{8 a}$ some representative chiral $\beta$-amino alcohols and the ee percentages of the ethylation of PhCHO with $\mathrm{Et}_{2} \mathrm{Zn}$ are given in Fig. 2. ${ }^{9}$ In general, enantioselectivities of $90-100 \%$ ee can be achieved for aromatic aldehydes using dialkylzincs. Starting from $(S)$-abrine, we prepared three classes of chiral ligands possessing an indole moiety, and examined their catalysis in the ethylation of aldehydes with $\mathrm{Et}_{2} \mathrm{Zn} .{ }^{10}$ They are secondary and tertiary $\beta$-amino alcohols, ${ }^{10 a}$ 2,4-cis-substituted 1,3-oxazolidines, ${ }^{10 b, d}$ and 1,2,3,4-tetrahydro- $\beta$-carbolines. ${ }^{10 \mathrm{c}}$ In this article, we disclose a full account of the synthesis and catalysis of chiral acyclic $\beta$-secondary and $\beta$-tertiary amino alcohols possessing a 3-indolylmethyl group. Emphasis will be put on the elucidation of the effect of a bulky $N$-alkyl chain on the enantioselectivity. A crystalline $\beta$-tertiary amino alcohol $\mathbf{2 1}$ has been found to promote the addition of $\mathrm{Et}_{2} \mathrm{Zn}$ to aldehydes in high ee's.

## 2. Results and discussion

### 2.1. Secondary amino alcohols

An examination on the chiral ligands illustrated in Fig. 2 revealed that both secondary and tertiary amines were used. A diphenylhydroxymethyl group was found in $\mathbf{1 0} \mathbf{- 1 3 a}, \mathbf{b}$ and $\mathbf{1 4 a} .{ }^{9 \mathrm{~d}, \mathrm{j}-\mathrm{m}, \mathrm{o}, \mathbf{q}, \mathrm{r}}$ Because of the enhanced stereoselectivity in catalytic reactions, the 'diarylhydroxymethyl group' is called the 'magic group' in catalyst design and synthesis and has been used with increasing frequency in recent years. ${ }^{11 \mathrm{a}}$ In contrast, chiral ligands possessing a dialkylhydroxymethyl group rarely provide high enantioselectivity. ${ }^{11 \mathrm{~b}}$ In 1995, we disclosed the chiral compound 21 (vide infra) containing the diethylhydroxymethyl group for use in the ethylation of aromatic aldehydes with $>90 \%$ ee's. ${ }^{10 a}$ Very recently, several groups also demonstrated the effect of the dialkylhydroxymethyl group in chiral compounds $\mathbf{8 b},{ }^{9 \mathrm{~g}} \mathbf{1 3 c},{ }^{9 \mathrm{p}} \mathbf{1 4 b},{ }^{9 \mathrm{p}}$ and others ${ }^{9 \mathrm{k}, \mathrm{m}, \mathrm{r}-\mathrm{t}}$ on enantioselectivity. It is known that $\beta$-secondary amino alcohols $\mathbf{5}$ and $\mathbf{1 2}$ possessing a bicyclic skeleton and $\mathbf{1 0}$ having an additional chelating site induce high enantioselectivity, whereas $\mathbf{1 1 a}{ }^{91}$ and others ${ }^{9 \mathrm{~g}, \mathrm{r}-\mathrm{t}}$ usually give low enantioselectivity. Chiral amino alcohol $\mathbf{1 3 a}{ }^{\mathbf{9 0}}$ gives an impressively high level of ee and this encouraged us to undertake the following investigations.

Our initial effort was to design and synthesize a number of $\beta$-secondary amino alcohols $\mathbf{1 5 a - g}$ bearing either a di- $n$-alkylhydroxymethyl or diarylhydroxymethyl group (Scheme 1). Conversion of $(S)$-abrine $\mathbf{1 b}$ into the methyl ester $\mathbf{1 c}$ was achieved by treatment of $\mathbf{1 b}$ with excess $\mathrm{SOCl}_{2}$ in MeOH in $95 \%$ yield. Addition of various Grignard reagents (in excess) to the ester 1c provided the tertiary alcohols $\mathbf{1 5 a - g}$ in $50-78 \%$ yield. An analogous compound $\mathbf{1 8}$ of $\mathbf{1 3 a}$ was also synthesized for comparison of the effect of the 3-indolylmethyl group in $\mathbf{1 8}$ with the benzyl group in 13a. Treatment of ( $S$ )-tryptophan methyl ester hydrochloride 16 with large excess PhMgCl in THF gave the alcohol $\mathbf{1 7}$ in $60 \%$ yield. Selective acylation of the primary amino group in $\mathbf{1 7}$ with isovaleryl
chloride $-\mathrm{Et}_{3} \mathrm{~N}$ at room temperature formed the corresponding amide in $69 \%$ yield. Finally, the amide was reduced by excess $\mathrm{LiAlH}_{4}$ in refluxing THF to furnish the $\beta$-secondary amino alcohol 18 in $56 \%$ yield (Scheme 1).

Scheme 1.

Catalysis of the above synthesized chiral ligands $\mathbf{1 5 a - g}$ and $\mathbf{1 8}$ was examined with PhCHO as the substrate under the standard conditions (entries $1-8$ in Table 1). The ethylation was carried out in dry PhMe:hexanes (2:1) in the presence of $10 \mathrm{~mol} \%$ chiral ligand at room temperature, and the reaction mixture was then quenched by $5 \%$ aqueous HCl in an ice-water bath. The product, 1-phenyl-1-propanol 19, was isolated by extraction and purified by column chromatography over silica gel and the ee was determined by HPLC analysis using a chiral stationary phase. In general, the chiral ligands 15a-d possessing a di-n-alkylhydroxymethyl group produced $(R)$ - $\mathbf{1 9}$ as the major enantiomer, whereas the chiral ligands $\mathbf{1 5 e - g}$ and $\mathbf{1 8}$, having a diarylhydroxymethyl group, induced ( $S$ ) $\mathbf{- 1 9}$ preferentially. This finding is of interest in the mechanistic consideration. In addition to the low enantioselectivity, the reaction time was significantly longer, the yield of the product was moderate, and benzyl alcohol was formed as the result of reduction by $\mathrm{Et}_{2} \mathrm{Zn}$. All these aspects indicated that the $\beta$-secondary amino alcohols $\mathbf{1 5 a - g}$ and $\mathbf{1 8}$ were not the efficient ligands. In particular, the diminished enantioselectivity induced by $\mathbf{1 8}$ compared to $\mathbf{1 3 a - b}$ suggested that the 3 -indolylmethyl group interfered with the functioning of the amino alcohol moiety. Because of the acidity of indole ( $\mathrm{p} K_{\mathrm{a}} 21.0$ in DMSO), ${ }^{12}$ a plausible zinc amide ${ }^{10 \mathrm{~d}, 13}$ might be formed through deprotonation of the indole moiety in 18 and competed for catalysis via multicomponent complexation. ${ }^{14}$ The less steric demand of the $N$-methyl group might be another factor for the inefficiency of the chiral ligands $\mathbf{1 5 a - g}$ in stereochemical control.

The effect of the $n$-alkyl chain length on enantioselectivity was observed in the chiral ligands 15a-d possessing a di- $n$-alkylhydroxymethyl group. As shown in Fig. 3, the \% ee of $(R)$ - $\mathbf{1 9}$ varied regularly with the length of the $n$-alkyl chain to form a 'zigzag' curve. The peaks were found for the chain length of odd number carbon. A maximum value of $44.9 \%$ ee was obtained with the $n$-propyl group. A similar phenomenon was noted in the chiral oxazolidine-catalyzed addition of $\mathrm{Et}_{2} \mathrm{Zn}$ to PhCHO. ${ }^{10 \mathrm{~d}}$ One can assume that this effect originates from the van der Waals interaction and reflects the conformational preference of the $n$-alkyl chain. The effect of the $N$ - $n$-alkyl group in $(1 S, 2 R)$ $N, N$-di- $n$-alkylnorephedrines ${ }^{15 a}$ and the polymer-supported $(1 S, 2 R)$ - $N$ - $n$-alkylnorephedrines ${ }^{15 b}$

Benzyl alcohol was formed as the byproduct and PhCHO was remained in most of the reactions. ${ }^{b}$ Isolated yield of alcohol 19. ${ }^{c}$ Determined by HPLC over a Chiralcel OD column eluted with hexane-2-propanol (97.5:2.5) at $1 \mathrm{~mL} / \mathrm{min}$ using UV detector at $254 \mathrm{~nm} ; t_{\mathrm{R}}=14.9 \mathrm{~min}$ for $(R)-\mathbf{1 9}$ and $t_{\mathrm{R}}=16.9 \mathrm{~min}$ for $(S)$-19. ${ }^{d}$ Assigned according to the sign of optical rotation and $t_{\mathrm{R}}$ of the HPLC analysis.
was examined, and the carbon number of the $n$-alkyl group for inducing the maximum $\%$ ee differed with the catalyst type and the substrate structure.

### 2.2. Tertiary amino alcohols

Next, we turned our attention to the synthesis of alcohols bearing a tertiary amino group. Because of the enhanced Lewis basicity of tertiary amines compared with the corresponding secondary ones, many known chiral ligands such as $\mathbf{4}, \mathbf{6}, \mathbf{7}, \mathbf{8 b}, \mathbf{9}, \mathbf{1 1 b}$ and $\mathbf{1 4 a}, \mathbf{b}$ given in Fig. 2 are tertiary amines and contain either a ring structure or two identical alkyl groups. As the result of less accessibility and complication in a complex formation, tertiary amines having three different substituents are seldom used in chiral ligands. Several tertiary amines having an $N$-methyl group were synthesized from ephedrine and pseudoephedrine. ${ }^{8 \mathrm{~d}, 16}$ High enantioselectivity in catalyzing $\mathrm{Et}_{2} \mathrm{Zn}$ addition toward aldehydes was observed for these $\beta$-amino alcohols. We prepared the tertiary amines 20a-d and $\mathbf{2 1}$ as shown in Scheme 2. Selective acylation of $\mathbf{1 5 f}$ with various RCOCl in the presence of $\mathrm{Et}_{3} \mathrm{~N}$ gave the amides which were reduced to the tertiary amines 20a-d by $\mathrm{LiAlH}_{4}$ in refluxing THF in $34-56 \%$ yield. Similarly, the crystalline $\beta$-tertiary amino alcohol 21 was prepared in $67 \%$ overall yield from $\mathbf{1 5 b}$.

Addition of $\mathrm{Et}_{2} \mathrm{Zn}$ toward PhCHO was carried out using $10 \mathrm{~mol} \%$ chiral ligand 20a-d and 21, respectively. The results are listed in Table 1, entries $9-13$. It is interesting to note that chiral ligand 20a still induced $(S) \mathbf{- 1 9}$, whereas 20b-d produced the antipodal enantiomer. In addition,

Scheme 2.
the \% ee of $(R)$ - $\mathbf{1 9}$ increased with increasing bulkiness of the $N$-alkyl group in the following order: 20b $\left(\mathrm{PhCH}_{2} \mathrm{CH}_{2}\right)<\mathbf{2 0} \mathbf{c}\left(i-\mathrm{PrCH}_{2} \mathrm{CH}_{2}\right)<\mathbf{2 0 d}\left(t-\mathrm{BuCH}_{2} \mathrm{CH}_{2}\right)$. A plot of the \% ee against the bulkiness of the $N$-alkyl group in 15f and 20a-d gave the ' $\sqrt{ }$ ' shaped curve (Fig. 3). The ligand 20d containing the $N-2-t$-butylethyl group produced $(R)-19$ in $57.9 \%$ ee. This is a much better result compared to the ligand $\mathbf{1 4 a}(22 \%$ ee $)$ shown in Fig. 2. Introduction of this 'magic' $2-t$-butylethyl group into $\mathbf{1 5 b}$ to form ligand 21 significantly improved the asymmetric induction from 7.1 to $87.5 \%$ ee for $(R)$-19. Chiral ligand $\mathbf{2 1}$ features some unique functional groups: a diethylhydroxymethyl group, a 3-indolylmethyl group, and an $N$-2-t-butylethyl group. It is readily synthesized from $(S)$-abrine $\mathbf{1 b}$ in four steps and in $41 \%$ overall yield. Compound 21 is a crystalline compound and is easy for purification and handling.

Figure 3. Effects of the alkyl group(s) in chiral ligands $\mathbf{1 5 a - d}, \mathbf{f}$ and 20a-d on the rotation sign and the ee of $\mathbf{1 9}$ formed via the ligand-promoted addition of $\mathrm{Et}_{2} \mathrm{Zn}$ toward PhCHO in PhMe :hexanes (2:1) at $20^{\circ} \mathrm{C}$

### 2.3. Catalysis of 21 in $E t_{2} \mathrm{Zn}$ addition toward aldehydes

With the ligand 21 in hand, we examined a number of aldehydes for the enantioselective ethylation with $\mathrm{Et}_{2} \mathrm{Zn}$ (Table 2). In general, high enantioselectivity of $>93 \%$ ee was obtained for
naphthaldehydes and $p$-, and $m$-substituted benzaldehydes, except for $o$-bromobenzaldehyde and $p$-dimethylaminobenzaldehyde. The former aldehyde may be affected by the bulky ortho bromine atom. For the latter substrate, the basic dimethylamino group in the substrate and the product $(R)-\mathbf{2 2 g}$ may contribute to some minor catalytic pathways. It then reduces the overall enantioselectivity. This argument is supported by the observation that $(R)$-1-phenyl-1-propanol $(R)$ - $\mathbf{1 9}$ underwent autoinduction in the addition of $\mathrm{Et}_{2} \mathrm{Zn}$ toward benzaldehyde in the presence of a catalytic amount of achiral amine. ${ }^{14 a}$ Low enantioselectivity ( $40 \%$ ee) was observed previously for $p$-dimethylaminobenzaldehyde catalyzed by an axially chiral pyridylphenol and was explained by the electronic effect of the para substituent. ${ }^{17 \mathrm{a}}$ We tried to make the Hammett plots of $\log [(R)$ $\mathbf{2 2} /(S)-\mathbf{2 2})]$ versus substituent constants $\sigma_{\mathrm{p}}^{+}$, $\sigma_{\mathrm{p}}$, or $\sigma_{\mathrm{I}}$ for $p-\mathrm{Me}_{2} \mathrm{~N}, p-\mathrm{MeO}, p-\mathrm{Me}, p-\mathrm{Cl}, p-\mathrm{Br}$, and

[^1]$p-\mathrm{H},{ }^{18}$ respectively. But the linearity of the plots is very poor. The data suggested that the stereochemistry of the ethylation catalyzed by chiral ligand $\mathbf{2 1}$ is not only determined by the electronic effect. ${ }^{17 \mathrm{~b}}$

A high enantioselectivity ( $94.8 \%$ ee) was obtained for $(R) \mathbf{- 2 2 m}$ formed from a saturated aldehyde, cyclohexanecarboxaldehyde. trans-Cinnamaldehyde gave a reasonably high ee of $81.3 \%$ for $(R)$ 221. The heterocyclic aromatic aldehydes, 2-furaldehyde and 2-thiophenecarboxaldehyde provided $(R)-\mathbf{2 2 q}(78.0 \%$ ee) and $(R)-\mathbf{2 2 r}(94.9 \%$ ee) in good to excellent enantioselectivity. However, pyridinecarboxaldehydes were the poorest substrates of the ethylation reaction giving 5.4 to $24.3 \%$ ee. ${ }^{19 \mathrm{a}}$ The results are interpreted by the competitive side catalytic cycle involving the basic heteroatom. In fact, autocatalysis of the nitrogen-containing aromatic aldehydes was investigated extensively by the Soai's group. ${ }^{19 b-i}$ For example, 3-pyridinecarboxaldehyde was converted into (-)-1-(3-pyridyl)-1-propanol (S)-22o of $14 \%$ ee in the presence of $20 \mathrm{~mol} \%$ of ( $S$ )-220 possessing $56 \%$ ee. ${ }^{19 \mathrm{~b}}$ In general, the ee of the product is much lower than the ee of the initially used promoter, except for the cases where the ee of the product is high (or higher than the ee of the initial catalyst) using a bulky $i-\operatorname{Pr}_{2} \mathrm{Zn} .{ }^{19 b-\mathrm{i}}$ Because of the proximity of the nitrogen atom to the reacting center, 2-pyridinecarboxaldehyde failed to give chiral 1-(2-pyridyl)-1-propanol in the chiral ligand-catalyzed ethylation. ${ }^{20}$ Another possibility is worthy of mentioning. Because of the bulkiness of the tertiary amino group in 21, complexation of the nitrogen atom with metal species is rather weak and can be easily replaced by other Lewis bases. This argument agrees well with the enhanced ee in $(R) \mathbf{- 2 2 n}, \mathbf{q}, \mathbf{r}$ according to the diminished Lewis basicity of the heteroatoms: pyridine $>$ furan $>$ thiophene. Therefore, in the presence of a stronger Lewis base, the chiral ligand 21 cannot function properly and gives a low ee of the product.

We examined the autocatalysis of $(R) \mathbf{- 2 2 q}$ and $(R) \mathbf{- 2 2 r}$ shown in Scheme 3. Compound $(R) \mathbf{- 2 2 q}$ with $82.0 \%$ ee was obtained from the ethylation of 2 -furaldehyde in $85 \%$ yield in the presence of the chiral ligand 23, previously synthesized by us from ( $S$ )-abrine (1b). ${ }^{10 \mathrm{c}}$ Using this chiral alcohol

Scheme 3.
$(R) \mathbf{- 2 2 q}\left(82.0 \%\right.$ ee) as the promoter ( $7.6 \mathrm{~mol} \%$ ), the addition of $\mathrm{Et}_{2} \mathrm{Zn}$ to 2-furaldehyde in PhMe:hexanes ( $2: 1$ ) completed within 96 h and $(R)$ - $\mathbf{2 2 q}$ was isolated in $92 \%$ yield and in $27.6 \%$ ee. ${ }^{21}$ Similarly, addition of $\mathrm{Et}_{2} \mathrm{Zn}$ to 2-thiophenecarboxaldehyde in the presence of $7.9 \mathrm{~mol} \%$ $(R)-\mathbf{2 2 r}\left(94.9 \%\right.$ ee) afforded $(R)-\mathbf{2 2 r}(13.9 \% \text { ee })^{21}$ in $69 \%$ yield with $87 \%$ conversion of the aldehyde. The newly formed product ee induced by $(R)-\mathbf{2 2 q}(82.0 \%$ ee $)$ and $(R)-\mathbf{2 2 r}(94.9 \%$ ee $)$ is calculated to be 23.1 and $3.1 \%$ ee, respectively. ${ }^{21}$ It is evident that $(R)$-1-( $2^{\prime}$-furyl)-1-propanol $(R)-\mathbf{2 2 q}$ is a much more efficient promoter than $(R)$-1-( $2^{\prime}$-thienyl)-1-propanol $(R)-\mathbf{2 2 r}$ in terms of reactivity and asymmetric autocatalysis. As a result of the autocatalysis by $(R) \mathbf{- 2 2 q}$, a relatively low enantioselectivity $(78.0 \%$ ee $)$ was obtained for the chiral ligand 21 promoted ethylation of 2-furaldehyde.

### 2.4. Transition state consideration

Noyori and co-workers investigated the chirality amplification phenomenon in the chiral $\beta$-amino alcohol promoted alkylation of aldehydes with dialkylzincs and demonstrated the existence of an equilibrium among monomeric and dimeric Zn -ligand complexes. ${ }^{22}$ Recently, they confirmed that the alkylation occurs through the monomeric alkylzinc aminoalkoxide as the catalytic species. ${ }^{23}$ In the product-forming transition state (TS), a dinuclear Zn complex with the chiral ligand and the aldehyde substrate was proposed. ${ }^{24 a}$ Based on the molecular orbital calculations at the restricted Hartree-Fock (RHF) level, the 5/4/4-fused tricyclic transition states were established and the alkyl migration was predicted to take place with retention of configuration. ${ }^{24 a, 25-27}$ Among the two possible stereoisomeric $\mu$-O TS', the anti-TS is $2.9 \mathrm{kcal} / \mathrm{mol}$ much more stable than the syn-TS. ${ }^{24 a}$ These results have recently been reproduced by Houk and Goldfuss in the PM3 and ONIOM(RHF/LanL2DZ:UFF) TS models. ${ }^{24 b, c}$ For the fenchone derivatives, the $\mu-\mathrm{O}$ syn-TS may dominate compared to the $\mu-\mathrm{O}$ anti-TS depending on the nature of the donor group. ${ }^{24 \mathrm{c}}$

According to these theoretical studies, we use the $a n t i-\mathrm{TS}(R)$ and $\operatorname{syn}-\mathrm{TS}(S)$ I and II to explain the stereochemistry induced by the chiral ligands $\mathbf{1 5 a - g}, \mathbf{1 8}, \mathbf{2 0 b}-\mathbf{d}$, and 21 (Fig. 4). ${ }^{28}$ Because of the gem disubstituents at the hydroxymethyl group, the chirality at the carbon bearing the 3-indolylmethyl group controls the stereochemical course of the alkylation. In both TS' I and II, the 3-indolylmethyl group points away from the $\mathrm{Zn}_{2} \mathrm{O}_{2}$ ring to minimize the steric interaction. For the anti-TS $(R) \mathbf{I}$, there may be a repulsive intereaction among the $\mathbf{X}^{\mathbf{1}}$ and the passive ethyl group $\mathrm{Et}_{\mathrm{p}}$. The two substituents on the nitrogen atom should be arranged with $\mathrm{R}_{\mathrm{L}}$ being opposite to the 3-indolylmethyl group. In the case of $\beta$-tertiary amino alcohols $\mathbf{2 0 b} \mathbf{- d}$ and $\mathbf{2 1}$, the bulky groups [3-indolylmethyl, $N-\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{X}(\mathrm{X}=\mathrm{Ph}, i-\mathrm{Pr}, t-\mathrm{Bu})$, and $\mathrm{Zn}_{\mathrm{a}}-\mathrm{Et}$ ] on the five-membered chelate align with each other in the 1,2-trans relationship. The ethyl group $\mathrm{Et}_{\mathrm{T}}$ is transferred from the $r e$-face of the aldehyde to form the $R$ enantiomer. The electron-rich diethylhydroxymethyl group in 21 should increase the Lewis basicity of the alkoxide and enhances the rigidity of the fivemembered chelate. It gives a higher preference for the anti-TS $(R)$ I and results in a better stereochemical control. This accounts for the excellent performance of the chiral ligand 21 described above, as well as the remarkably improved enantioselectivity of $\mathbf{1 4 b}$ over $\mathbf{1 4 a}$ (Fig. 2). It has been known that the $\beta$-secondary amino alcohols 13a-c induced the $S$ alcohols, ${ }^{9 \mathrm{o}, \mathrm{p}}$ and a zinc monoalkoxide was proposed as the catalytic species. ${ }^{90}$ We suggest the $\operatorname{syn}-\mathrm{TS}(S)$ II for the asymmetric induction of $\mathbf{1 5 e - g}$ and 18. With $\mathrm{R}_{\mathrm{S}}$ being H , steric repulsion between $\mathrm{R}_{\mathrm{S}}$ and the transferring ethyl group $\mathrm{Et}_{\mathrm{T}}$ is less demanding. Thus, TS II becomes much more stable than $\mathbf{I}$ and the $S$ product is formed predominantly. ${ }^{24 \mathrm{c}}$ A similar TS of the type II can be proposed for the catalysis of 13a-c.

The higher ee observed for $\mathbf{1 3 a - c}$ compared to $\mathbf{1 8}$ may be rationalized by considering the possible catalysis of an indole zinc amide of $\mathbf{1 8} .{ }^{10 \mathrm{~d}}$ For the ligands $\mathbf{1 5 a - d}$, a reversal in asymmetric induction was observed. It may result from the preference of anti-TS $(R)$ I over $\operatorname{syn}-\mathrm{TS}(S)$ II where the steric repulsion between $\mathbf{X}^{\mathbf{2}}$ (alkyl) and $\mathrm{Et}_{\mathrm{T}}$ causes destabilization. It seems reasonable that the electronic effect of the alkoxide should enhance the rigidity of the five-membered chelate and bring the $\mathbf{X}^{\mathbf{2}}$ (alkyl) closer to $\mathrm{Et}_{\mathrm{T}}$ in $\operatorname{syn}-\mathrm{TS}(S) \mathbf{I I}$. Moreover, an alkyl group may have a larger 'effective size' than an aryl group. Thus, both electronic and steric effects of the dialkylhydroxymethyl group in the $\beta$-secondary amino alcohols 15a-d destabilizes the syn-TS(S) II. However, it must be mentioned that the energy difference between anti-TS $(R)$ I and $\operatorname{syn}-\mathrm{TS}(S)$ II may be within $3 \mathrm{kcal} / \mathrm{mol}$ according to reported calculations. ${ }^{24}$ It is not surprising to see the preference for the TS switched over with a minor modification on the catalyst structure.

$\mathrm{X}^{1}=\mathrm{X}^{2}=$ alkyl, $p-\mathrm{MePh}$

Figure 4. 5/4/4-Fused tricyclic transition states for chiral ligand-promoted ethylation of aldehydes

## 3. Conclusion

We have synthesized a novel series of chiral $\beta$-amino alcohols 15a-g, 20a-d, and 21 from the alkaloid, (S)-abrine, isolated from the red beans of Abrus precatorius L. Enantioselective ethylation of aldehydes with $\mathrm{Et}_{2} \mathrm{Zn}$ was investigated in the presence of a catalytic amount of the chiral $\beta$-amino alcohols and the effects of the ligand structures on the enantioselectivity were examined. As a result of our efforts, a chiral ligand 21 was discovered. This promoted the ethylation of a number of naphthaldehydes, $p$ - and $m$-substituted benzaldehydes, cyclohexanecarboxaldehyde, and 2-thiophenecarboxaldehyde in $>93 \%$ ee. An anti 5/4/4-fused tricyclic TS I was proposed to rationalize the asymmetric induction. Unlike the known cyclic $\beta$-amino alcohols, such as the pyrrolidine derivatives 10-12, and $\beta$-amino alcohols attached to a ring skeleton, such as the camphor derivatives $\mathbf{4}$ and 5, acyclic $\beta$-amino alcohols are relatively flexible for positioning the $N$-alkyl groups in the aminoalkoxide-zinc chelate. Particularly, unsymmetrical tertiary amines can form two possible chelates and reduce the stereochemical control in the TS. The success of the chiral ligand 21 relies on the larger steric difference among the $N$-methyl and the $N$-2-t-butylethyl groups. In combination with the electron-rich diethylhydroxylmethyl group, a well-defined and rigid TS I operates for the 21-promoted ethylation. The 3-indolylmethyl group does not seem to be absolutely necessary and other bulky arylmethyl substituents should act in a similar manner. ${ }^{9 p}$

We believe that the results described above are very helpful in a novel chiral ligand design for enantioselective catalysis. The current study provides another good example for the use of natural products as a source of chiral ligands.

## 4. Experimental

### 4.1. General methods

${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded in $\mathrm{CDCl}_{3}\left(300,400\right.$, or 500 MHz for ${ }^{1} \mathrm{H}$ and 75,100 , or 125 MHz for ${ }^{13} \mathrm{C}$, respectively) with $\mathrm{CHCl}_{3}$ as the internal reference. IR spectra were taken on a FT-IR spectrophotometer. Mass spectra (MS) were measured by CI or FAB method. Both high resolution mass spectra (HRMS, measured by EI or FAB method) and elemental analysis were performed by Kunming Institute of Botany, The Chinese Academy of Sciences. All reactions were carried out under a nitrogen atmosphere and monitored by thin-layer chromatography on 0.25 mm E. Merck silica gel plates ( 60 F-254) using UV light, or 7\% ethanolic phosphomolybdic acid and heating as the visualizing methods. E. Merck silica gel ( 60 , particle size $0.040-0.063 \mathrm{~mm}$ ) was used for flash column chromatography. Yields refer to chromatographically and spectroscopically ( ${ }^{1} \mathrm{H}$ NMR) homogeneous materials. ( $S$ )-Abrine was isolated from the extract of the seeds of Abrus precatorius collected in the Yunnan Province of China. ${ }^{5} \mathrm{Et}_{2} \mathrm{Zn}$ ( 1.0 M in hexanes) and other reagents were obtained commercially and used as received. Room temperature is around $20^{\circ} \mathrm{C}$.

## 4.2. (S)-Abrine methyl ester 1c

To methanol ( 20 mL ) in a 250 mL round-bottomed flask cooled to $-20--15^{\circ} \mathrm{C}$ was added dropwise $\mathrm{SOCl}_{2}(1.0 \mathrm{~mL})$. After stirring for $15 \mathrm{~min},(S)$-abrine $\mathbf{1 b}(1.50 \mathrm{~g}, 6.88 \mathrm{mmol})$ was added followed by stirring at room temperature for 48 h . The reaction mixture was condensed under reduced pressure, water was added to the residue, and the aqueous solution was adjusted to pH $9-10$ using saturated aqueous $\mathrm{Na}_{2} \mathrm{CO}_{3}$. The resultant aqueous solution was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 40 \mathrm{~mL})$, and the organic layer was washed with brine, dried over anhydrous $\mathrm{MgSO}_{4}$, filtrated, and condensed under reduced pressure to give 1c ( $1.52 \mathrm{~g}, 95 \%$ ): pale yellow oil; ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.88(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 7.65(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.30(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H})$, $7.28-7.13(\mathrm{~m}, 2 \mathrm{H}), 6.97(\mathrm{~s}, 1 \mathrm{H}), 3.71(\mathrm{~s}, 3 \mathrm{H}), 3.64(\mathrm{t}, J=6.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.26(\mathrm{dd}, J=14.4,5.8 \mathrm{~Hz}$, $1 \mathrm{H}), 3.17(\mathrm{dd}, J=14.4,7.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.42(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 175.0,136.2$, 127.2, 123.0, 121.7, 119.1, 118.4, 111.2, 110.4, 63.7, 51.6, 34.6, 29.0; HRMS (+EI) calcd for $\mathrm{C}_{13} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{2}\left(\mathrm{M}^{+}\right)$: 232.1212 ; found: 232.1195.

### 4.3. Synthesis of secondary amino alcohols from 1c; general procedure

To a solution of $\mathbf{1 c}(1.00 \mathrm{~g}, 4.3 \mathrm{mmol})$ in dry THF ( 20 mL ) cooled in an ice-water bath (ca. $0^{\circ} \mathrm{C}$ ) was added a THF solution of RMgBr or ArMgBr ( 6 mol equiv.) followed by stirring at room temperature for 15 h . The reaction mixture was quenched by saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ and extracted with EtOAc $(3 \times 50 \mathrm{~mL})$. The combined organic layer was washed with brine, dried over anhydrous $\mathrm{MgSO}_{4}$, filtered, and concentrated in vacuo. The residue was purified by flash column chromatography (silica gel, $5 \% \mathrm{MeOH}-\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) to give the alcohols.

### 4.3.1. 3-(3'-Indolyl)-1,1-dimethyl-(2S)-(N-methylamino)-1-propanol 15a

Prepared from 1c in 78\% yield; pale yellow foam; $[\alpha]_{\mathrm{D}}^{20}-48.2(c=1.05, \mathrm{MeOH})$; $\mathrm{IR}(\mathrm{KBr}) 3332$, 3224 (br), 1457, 1359, $1171 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 9.03$ (br s, 1H), 7.54 (d, $J=7.44$ $\mathrm{Hz}, 1 \mathrm{H}), 7.32(\mathrm{~d}, J=8.12 \mathrm{~Hz}, 1 \mathrm{H}), 7.14(\mathrm{t}, J=7.08 \mathrm{~Hz}, 1 \mathrm{H}), 7.06(\mathrm{t}, J=7.56 \mathrm{~Hz}, 1 \mathrm{H}), 7.03(\mathrm{~s}, 1 \mathrm{H})$, 3.28 (br s, 2H), 3.02 (d, $J=12.48 \mathrm{~Hz}, 1 \mathrm{H}$ ), 2.70-2.61 (m, 2H), 2.11 ( $\mathrm{s}, 3 \mathrm{H}$ ), 1.33 (s, 3H), 1.17 (s, $3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 136.5,127.2,122.4,121.8,119.0,118.4,112.7,111.3,72.0$, 68.9, 37.0, 27.5, 26.8, 23.8; MS (+FAB) $m / z$ (relative intensity) $233\left(\mathrm{M}+\mathrm{H}^{+}, 100\right)$; HRMS (+FAB) calcd for $\mathrm{C}_{14} \mathrm{H}_{21} \mathrm{~N}_{2} \mathrm{O}\left(\mathrm{M}+\mathrm{H}^{+}\right)$: 233.1654; found: 233.1664.

### 4.3.2. 1,1-Diethyl-3-(3'-indolyl)-(2S)-(N-methylamino)-1-propanol 15b

Prepared from 1c in $64 \%$ yield; pale yellow foam; $[\alpha]_{\mathrm{D}}^{20}-51.9\left(c=2.24, \mathrm{CHCl}_{3}\right)$; IR ( KBr ) 3420 (br), 1460, 1360, $1110 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.20$ (br s, 1 H ), 7.64 (d, $J=7.8 \mathrm{~Hz}$, $1 \mathrm{H}), 7.38(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.24-7.12(\mathrm{~m}, 2 \mathrm{H}), 7.04(\mathrm{~d}, J=2.1 \mathrm{~Hz}, 1 \mathrm{H}), 3.07(\mathrm{dd}, J=10.8,3.6$ $\mathrm{Hz}, 1 \mathrm{H}), 2.80(\mathrm{dd}, J=14.1,3.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.65(\mathrm{dd}, J=14.7,10.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.11$ (s, 3H), 1.74-1.51 $(\mathrm{m}, 4 \mathrm{H}), 1.00(\mathrm{t}, J=7.5 \mathrm{~Hz}, 6 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 136.5,127.6,122.2,122.1,119.4$, 118.7, 113.8, 111.3, 74.9, 65.0, 38.2, 28.7, 27.0, 26.6, 8.0, 7.9; MS (+CI) $m / z$ (relative intensity) 261 $\left(\mathrm{M}+\mathrm{H}^{+}, 100\right)$; HRMS $(+\mathrm{FAB})$ calcd for $\mathrm{C}_{16} \mathrm{H}_{25} \mathrm{~N}_{2} \mathrm{O}\left(\mathrm{M}+\mathrm{H}^{+}\right)$261.1967; found: 261.1977; anal. calcd for $\mathrm{C}_{16} \mathrm{H}_{24} \mathrm{~N}_{2} \mathrm{O}: \mathrm{C}, 73.81 ; \mathrm{H}, 9.29$; N, 10.76; found: C, 73.85; H, 9.37; N, 10.48.

### 4.3.3. 3-(3'-Indolyl)-(2S)-(N-methylamino)-1,1-di-n-propyl-1-propanol 15c

Prepared from 1c in $60 \%$ yield; pale yellow foam; $[\alpha]_{\mathrm{D}}^{20}-13.0(c=1.02, \mathrm{MeOH})$; IR (KBr) 3264 (br), 1459, 1436, $1354 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.15$ (br s, 1H), 7.56 (d, $J=7.88 \mathrm{~Hz}$, $1 \mathrm{H}), 7.39(\mathrm{~d}, J=8.12 \mathrm{~Hz}, 1 \mathrm{H}), 7.20-7.13(\mathrm{~m}, 2 \mathrm{H}), 7.11(\mathrm{t}, J=7.05 \mathrm{~Hz}, 1 \mathrm{H}), 3.56(\mathrm{br} \mathrm{s}, 2 \mathrm{H}), 3.09$ (dd, $J=14.77,2.76 \mathrm{~Hz}, 1 \mathrm{H}), 2.94(\mathrm{dd}, J=10.86,3.16 \mathrm{~Hz}, 1 \mathrm{H}), 2.80(\mathrm{dd}, J=14.72,11.02 \mathrm{~Hz}, 1 \mathrm{H})$, $2.10(\mathrm{~s}, 3 \mathrm{H}), 1.75-1.40(\mathrm{~m}, 8 \mathrm{H}), 0.98(\mathrm{t}, J=7.06 \mathrm{~Hz}, 3 \mathrm{H}), 0.96(\mathrm{t}, J=7.06 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( 125 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 136.6,127.0,123.2,121.8,119.1,118.2,111.5(\times 2), 75.0,66.4,39.3,37.3,37.1$, $29.6,25.8,16.6,14.7,14.6$; MS (+FAB) $m / z$ (relative intensity) $289\left(\mathrm{M}+\mathrm{H}^{+}, 57\right)$; HRMS (+FAB) calcd for $\mathrm{C}_{18} \mathrm{H}_{29} \mathrm{~N}_{2} \mathrm{O}\left(\mathrm{M}+\mathrm{H}^{+}\right)$: 289.2280 ; found: 289.2194 .

### 4.3.4. 1,1-Di-n-butyl-3-(3'-indolyl)-(2S)-(N-methylamino)-1-propanol 15d

Prepared from 1c in $63 \%$ yield; pale yellow foam; $[\alpha]_{\mathrm{D}}^{20}-11.7(c=0.32, \mathrm{MeOH})$; IR $(\mathrm{KBr}) 3467$, 3415,3309 (br), $1458 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.12$ (br s, 1 H ), 7.62 (d, $J=7.70 \mathrm{~Hz}$, $1 \mathrm{H}), 7.37(\mathrm{~d}, J=8.10 \mathrm{~Hz}, 1 \mathrm{H}), 7.21(\mathrm{t}, J=7.00 \mathrm{~Hz}, 1 \mathrm{H}), 7.14(\mathrm{t}, J=7.05 \mathrm{~Hz}, 1 \mathrm{H}), 7.06(\mathrm{~d}, J=1.95$ $\mathrm{Hz}, 1 \mathrm{H}$ ), 3.06 (ddd, $J=14.63,3.61,0.92 \mathrm{~Hz}, 1 \mathrm{H}), 2.79(\mathrm{dd}, J=10.68,3.64 \mathrm{~Hz}, 1 \mathrm{H}), 2.66$ (dd, $J=14.64,10.70 \mathrm{~Hz}, 1 \mathrm{H}), 2.11(\mathrm{~s}, 3 \mathrm{H}), 1.70-1.25(\mathrm{~m}, 12 \mathrm{H}), 0.95(\mathrm{t}, J=7.23 \mathrm{~Hz}, 3 \mathrm{H}), 0.92(\mathrm{t}$, $J=7.17 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 136.5,127.6,122.3,122.2,119.4,118.7,113.8$, $111.3,74.8,65,8,38.2,36.9,35.0,26.7,25.8,25.75,23.7,23.5,14.2(\times 2)$; MS (+FAB) $m / z$ (relative intensity) $317\left(\mathrm{M}+\mathrm{H}^{+}, 100\right)$; HRMS $(+\mathrm{FAB})$ calcd for $\mathrm{C}_{20} \mathrm{H}_{33} \mathrm{~N}_{2} \mathrm{O}\left(\mathrm{M}+\mathrm{H}^{+}\right)$: 317.2593 ; found: 317.2539 .

Prepared from 1c in 59\% yield; pale yellow foam; $[\alpha]_{\mathrm{D}}^{20}-12.5\left(c=1.94, \mathrm{CHCl}_{3}\right)$; IR ( KBr ) 3400 (br), $1450 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.10(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 7.67-7.59(\mathrm{~m}, 5 \mathrm{H}), 7.34$ (d, $J=8.1$ $\mathrm{Hz}, 1 \mathrm{H}), 7.24-7.12(\mathrm{~m}, 6 \mathrm{H}), 6.97(\mathrm{~d}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.94(\mathrm{dd}, J=10.5,2.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.60-2.50(\mathrm{br}$ $\mathrm{s}, 2 \mathrm{H}), 2.95(\mathrm{dd}, J=15.3,2.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.62(\mathrm{dd}, J=15.3,10.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.32(\mathrm{~s}, 3 \mathrm{H}), 2.31(\mathrm{~s}, 3 \mathrm{H})$, 1.85 (s, 3H); ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 145.1,142.6,136.5,135.9,135.8,128.9,128.8,127.5$, $125.8,125.5,122.4,122.1,119.4,118.9,113.4,111.2,77.8,66.4,37.2,27.2,20.9,20.8$; MS (+CI) $m / z$ (relative intensity) $385\left(\mathrm{M}+\mathrm{H}^{+}, 100\right)$; HRMS $(+\mathrm{FAB})$ calcd for $\mathrm{C}_{26} \mathrm{H}_{29} \mathrm{~N}_{2} \mathrm{O}\left(\mathrm{M}+\mathrm{H}^{+}\right)$: 385.2280; found: 385.2242; anal. calcd for $\mathrm{C}_{26} \mathrm{H}_{28} \mathrm{~N}_{2} \mathrm{O}: \mathrm{C}, 81.21 ; \mathrm{H}, 7.34 ; \mathrm{N}, 7.29$; found: C, 81.50; H, 7.43; N, 7.01.

### 4.3.7. 3-(3'-Indolyl)-(2S)-(N-methylamino)-1,1-di(2'-methylphenyl)-1-propanol $15 g$

Prepared from 1c in $50 \%$ yield; pale yellow foam; $[\alpha]_{\mathrm{D}}^{20}-45.6\left(c=2.27, \mathrm{CHCl}_{3}\right)$; IR ( KBr ) 3398 (br), $1452 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.01$ (br s, 1H), 7.81 (br d, $J=6.0 \mathrm{~Hz}, 1 \mathrm{H}$ ), 7.68 (dd, $J=7.7,1.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.57(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.35(\mathrm{dd}, J=7.0,1.0 \mathrm{~Hz}, 1 \mathrm{H}), 7.25-7.10(\mathrm{~m}$, $7 \mathrm{H}), 7.05(\mathrm{~d}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.82(\mathrm{~d}, J=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.06(\mathrm{dd}, J=9.6,3.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.05(\mathrm{dd}$, $J=15.6,3.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.62(\mathrm{dd}, J=15.3,9.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.22(\mathrm{~s}, 3 \mathrm{H}), 2.16(\mathrm{~s}, 6 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (75 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 143.4,142.1,138.8,136.4,132.8,132.2,128.4,127.5,127.3,127.0,126.8,124.8$, $124.5,122.1,122.0,119.4,118.7,113.7,111.2,81.0,64.0,36.5,28.1,22.4,22.0$; MS (+CI) m/z (relative intensity) $385\left(\mathrm{M}+\mathrm{H}^{+}, 100\right)$; HRMS $(+\mathrm{FAB})$ calcd for $\mathrm{C}_{26} \mathrm{H}_{29} \mathrm{~N}_{2} \mathrm{O}\left(\mathrm{M}+\mathrm{H}^{+}\right)$: 385.2280; found: 385.2253; anal. calcd for $\mathrm{C}_{26} \mathrm{H}_{28} \mathrm{~N}_{2} \mathrm{O}$ : C, 81.21; H, 7.29; N, 7.29; found: C, 81.57; H, 7.50; N, 6.98.

## 4.4. (2S)-Amino-3-(3'-indolyl)-1,1-diphenyl-1-propanol 17

To a solution of L-tryptophan methyl ester hydrochloride ( $\mathbf{1 6}, 1.05 \mathrm{~g}, 3.93 \mathrm{mmol}$ ) in dry THF $(20 \mathrm{~mL})$ cooled in an ice-water bath (ca. $\left.0^{\circ} \mathrm{C}\right)$ was added a solution of $\mathrm{PhMgCl}(15.0 \mathrm{~mL}, 2.0 \mathrm{M}$ in THF, 30.0 mmol ) followed by stirring at room temperatue for 19 h . The reaction mixture was quenched by saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 30 \mathrm{~mL})$. The combined organic layer was washed with brine, dried over anhydrous $\mathrm{MgSO}_{4}$, filtered, and concentrated in vacuo. The residue was purified by flash column chromatography (silica gel, $\mathrm{MeOH}: \mathrm{CH}_{2} \mathrm{Cl}_{2}:$ hexane $=1: 10: 10$ ) to give 17 ( $852 \mathrm{mg}, 60 \%$ ): pale yellow foam; ${ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.05(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 7.67$ (t, $J=8.7 \mathrm{~Hz}, 4 \mathrm{H}), 7.52(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.45-7.15(\mathrm{~m}, 9 \mathrm{H}), 7.03(\mathrm{~d}, J=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.30(\mathrm{dd}$, $J=10.2,3.0 \mathrm{~Hz}, 1 \mathrm{H}), 2.75(\mathrm{dd}, J=14.7,2.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.66(\mathrm{dd}, J=14.4,10.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.10-1.40$ (br s, 2H); ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 147.1,144.5,136.6,128.5,128.3,127.3,126.7,126.6$, $125.8,125.4,122.6,122.2,119.4,118.9,113.4,111.3,78.5,56.4,26.3$.

### 4.5. 3-(3'-Indolyl)-(2S)-(isovalerylamino)-1,1-diphenyl-1-propanol

To a solution of $\mathbf{1 7}(340 \mathrm{mg}, 0.99 \mathrm{mmol})$ in dry THF ( 5 mL ) cooled in an ice-water bath was added $\mathrm{Et}_{3} \mathrm{~N}(0.18 \mathrm{~mL}, 1.29 \mathrm{mmol})$ and isovaleryl chloride $(0.14 \mathrm{~mL}, 1.15 \mathrm{mmol})$ followed by stirring at room temperature for 6 h . The precipitate was filtered off through Celite with rinsing
by $\mathrm{Et}_{2} \mathrm{O}(3 \times 20 \mathrm{~mL})$. The combined organic layer was washed with brine, dried over anydrous $\mathrm{MgSO}_{4}$, filtered, and condensed under reduced pressure. The residue was purified by flash column chromatography (silica gel, $25 \%$ EtOAc-hexane) to give the amide of 17 ( $295 \mathrm{mg}, 69 \%$ ): pale yellow foam; IR (KBr) 3410,3320 (br), 1640, $1450 \mathrm{~cm}^{-1 ; 1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}$ ) $\delta 8.87$ (br $\mathrm{s}, 1 \mathrm{H}), 7.56-7.51(\mathrm{~m}, 2 \mathrm{H}), 7.43-7.38(\mathrm{~m}, 2 \mathrm{H}), 7.25-7.14(\mathrm{~m}, 2 \mathrm{H}), 7.09-7.00(\mathrm{~m}, 4 \mathrm{H}), 6.96-6.88(\mathrm{~m}$, 2H), $6.84(\mathrm{~d}, J=2.4 \mathrm{~Hz}, 1 \mathrm{H}), 6.79$ (ddd, $J=8.1,6.9,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.40(\mathrm{~d}, J=8.8 \mathrm{~Hz}, 1 \mathrm{H}), 5.57$ (br s, 1H), 4.73 (ddd, $J=11.9,8.7,2.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.91(\mathrm{dd}, J=14.7,11.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.57$ (ddd, $J=14.7$, $2.1,0.6 \mathrm{~Hz}, 1 \mathrm{H}), 11.55-1.41(\mathrm{~m}, 3 \mathrm{H}), 0.35(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H}), 0.29(\mathrm{~d}, J=6.0 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $\left(75 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{CN}\right) \delta 172.9,147.0,146.3,136.4,128.3,127.7,126.6,126.3,125.8,125.6,123.1$, $121.1,118.6,118.3,112.3,111.2,80.5,58.8,45.2,25.6,24.4,21.4,21.2$; MS (+CI) $m / z$ (relative intensity) $427\left(\mathrm{M}+\mathrm{H}^{+}, 8\right), 409\left(\mathrm{M}^{+}-\mathrm{H}_{2} \mathrm{O}, 11\right), 280(100)$; HRMS (+FAB) calcd for $\mathrm{C}_{28} \mathrm{H}_{31} \mathrm{~N}_{2} \mathrm{O}_{2}$ $\left(\mathrm{M}+\mathrm{H}^{+}\right)$: 427.2386; found: 427.2470; anal. calcd for $\mathrm{C}_{28} \mathrm{H}_{30} \mathrm{~N}_{2} \mathrm{O}_{2}: \mathrm{C}, 78.84 ; \mathrm{H}, 7.09$; $\mathrm{N}, 6.57$; found: C, $78.59 ; \mathrm{H}, 7.42 ; \mathrm{N}, 6.30$.

### 4.6. 3-(3'-Indolyl)-(2S)-(3'-methylbutylamino)-1,1-diphenyl-1-propanol 18

To a suspension of $\mathrm{LiAlH}_{4}(76 \mathrm{mg}, 2.00 \mathrm{mmol})$ in dry THF $(10 \mathrm{~mL})$ cooled in an ice-water bath (ca. $0^{\circ} \mathrm{C}$ ) was added a solution of the amide obtained above from $17(200 \mathrm{mg}, 0.47 \mathrm{mmol})$ in dry THF ( 5 mL ). The resultant mixture was then heated at refluxing temperature for 43 h . After cooled to ca. $0^{\circ} \mathrm{C}$ in an ice-water bath, the reaction mixture was quenched by $5 \%$ aqueous NaOH $(4 \mathrm{~mL})$ and filtered through Celite with rinsing by EtOAc. The filtrate was extracted with EtOAc $(3 \times 20 \mathrm{~mL})$, and the combined organic layer was washed with brine, dried over anhydrous $\mathrm{MgSO}_{4}$, filtered, and condensed in vacuo. The residue was purified by flash column chromatography (silica gel, $20 \%$ EtOAc-hexane) to give 18 (109 mg, 56\%) : pale yellow foam; $[\alpha]_{\mathrm{D}}^{20}-23.4(c=2.18$, $\mathrm{CHCl}_{3}$ ); IR (KBr) 3420 (br), 1450, $1350 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 8.01$ (br s, 1H), 7.78 (t, $J=8.1 \mathrm{~Hz}, 4 \mathrm{H}), 7.65(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.40-7.17(\mathrm{~m}, 9 \mathrm{H}), 6.95(\mathrm{~d}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.60-5.05$ (br s, 2H), 4.04 (dd, $J=10.8,2.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.95(\mathrm{dd}, J=15.3,2.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.56$ (dd, $J=15.3,11.1$ Hz, 1H), 1.98 (dt, $J=11.4,6.9 \mathrm{~Hz}, 1 \mathrm{H}$ ), 1.85 (dt, $J=11.4,6.9 \mathrm{~Hz}, 1 \mathrm{H}$ ), 1.10 (sept., $J=6.6 \mathrm{~Hz}$, $1 \mathrm{H}), 0.90-0.75(\mathrm{~m}, 2 \mathrm{H}), 0.53(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H}), 0.43(\mathrm{~d}, J=6.6 \mathrm{~Hz}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $(75 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 148.2,145.5,136.6,128.1,128.0,127.5,126.4,126.3,126.0,125.7,122.2,122.1,119.4$, $118.9,113.5,111.2,77.6,64.5,47.7,39.2,27.4,25.1,22.3,22.0$; MS (+CI) $m / z$ (relative intensity) $413\left(\mathrm{M}+\mathrm{H}^{+}, 100\right)$; HRMS (+FAB) calcd for $\mathrm{C}_{28} \mathrm{H}_{33} \mathrm{~N}_{2} \mathrm{O}\left(\mathrm{M}+\mathrm{H}^{+}\right)$: 413.2593; found: 413.2506; anal. calcd for $\mathrm{C}_{28} \mathrm{H}_{32} \mathrm{~N}_{2} \mathrm{O}: \mathrm{C}, 81.51 ; \mathrm{H}, 7.82 ; \mathrm{N}, 6.79$; found: C, 81.41; H, 7.98; N, 6.66.

### 4.7. Synthesis of amides of $\mathbf{1 5 b}$ and $\mathbf{1 5 f}$; general procedure

To a solution of $\mathbf{1 5 b}$ or $\mathbf{1 5 f}(3.03 \mathrm{mmol})$ in dry THF ( 30 mL ) cooled in an ice-water bath was added $\mathrm{Et}_{3} \mathrm{~N}(0.50 \mathrm{~mL}, 3.59 \mathrm{mmol})$ and the acyl chloride ( 3.60 mmol ) followed by stirring at room temperature for 17 h . The precipitate was filtered off through Celite with rinsing by $\mathrm{Et}_{2} \mathrm{O}(3 \times 30 \mathrm{~mL})$. The combined organic layer was washed with brine, dried over anydrous $\mathrm{MgSO}_{4}$, filtered, and condensed under reduced pressure. The residue was purified by flash column chromatography (silica gel, EtOAc:hexane: $\mathrm{CH}_{2} \mathrm{Cl}_{2}=1: 3: 3$ ) to give the amide.

### 4.7.1. 1,1-Diethyl-3-( $3^{\prime}$-indolyl)-(2S)-(N-methyl-N-3", $3^{\prime \prime}$-dimethylbutyrylamino)-1-propanol

Prepared from 15b in 94\% yield; pale yellow foam; IR (KBr) $3250(\mathrm{br}), 1600,1450,1355 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.26(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 7.56(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.37(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H})$,

### 4.8. Synthesis of tertiary amino alcohols by $\mathrm{LiAlH}_{4}$ reduction of amides; general procedure

To a suspension of $\mathrm{LiAlH}_{4}(217 \mathrm{mg}, 5.72 \mathrm{mmol})$ in dry THF $(10 \mathrm{~mL})$ cooled in an ice-water bath (ca. $0^{\circ} \mathrm{C}$ ) was added a solution of the amide obtained above from $\mathbf{1 5 b}$ or $\mathbf{1 5 f}(2.79 \mathrm{mmol})$ in dry THF ( 20 mL ). The resultant mixture was then heated at refluxing temperature for 12 h . After cooled to $\mathrm{ca} .0^{\circ} \mathrm{C}$ in an ice-water bath, the reaction mixture was quenched by $5 \%$ aqueous NaOH $(4 \mathrm{~mL})$ and filtered through Celite with rinsing by EtOAc. The filtrate was extracted with EtOAc $(3 \times 20 \mathrm{~mL})$, and the combined organic layer was washed with brine, dried over anhydrous $\mathrm{MgSO}_{4}$, filtered, and condensed in vacuo. The residue was purified by flash column chromatography (silica gel, $\mathrm{MeOH}: \mathrm{CH}_{2} \mathrm{Cl}_{2}$ :hexane $=1: 8: 16$ ) to give the product.

### 4.8.1. (2S)-(N-Benzyl-N-methylamino)-3-(3'-indolyl)-1,1-di(4'-methylphenyl)-1-propanol 20a

Prepared from the corresponding amide in 70\% yield; pale yellow foam; $[\alpha]_{\mathrm{D}}^{20}-10.2(c=2.10$, $\mathrm{CHCl}_{3}$ ); IR ( KBr ) 3410 (br), $1450,1340 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.15$ (br s, 1H), $7.59-7.49(\mathrm{~m}, 5 \mathrm{H}), 7.36(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.23-7.17(\mathrm{~m}, 9 \mathrm{H}), 7.04-6.99(\mathrm{~m}, 3 \mathrm{H}), 4.23$ (dd, $J=9.3,4.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.52(\mathrm{~d}, J=13.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.30(\mathrm{~d}, J=13.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.24-3.21(\mathrm{~m}, 2 \mathrm{H}), 2.38$ ( $\mathrm{s}, 3 \mathrm{H}$ ), $2.37(\mathrm{~s}, 3 \mathrm{H}), 1.98(\mathrm{~s}, 3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 143.1,141.2$, 139.4, 136.7, 136.4, $136.2,128.7,128.6,128.5,128.3,128.2,128.0,127.4,127.2$, 126.9, 122.5, 122.0, 119.3, 119.1, $114.3,111.2,78.5,72.0,61.5,38.3,23.6,21.0 ; \mathrm{MS}(+\mathrm{CI}) \mathrm{m} / \mathrm{z}$ (relative intensity) $475\left(\mathrm{M}+\mathrm{H}^{+}, 100\right)$; HRMS (+FAB) calcd for $\mathrm{C}_{33} \mathrm{H}_{35} \mathrm{~N}_{2} \mathrm{O}\left(\mathrm{M}+\mathrm{H}^{+}\right.$: 475.2749; found: 475.2785; anal. calcd for $\mathrm{C}_{33} \mathrm{H}_{34} \mathrm{~N}_{2} \mathrm{O}: \mathrm{C}, 83.51 ; \mathrm{H}, 7.22$; N, 5.90 ; found: C, $83.60 ; \mathrm{H}, 7.29$; N, 5.69.

### 4.8.2. 3-(3'-Indolyl)-(2S)-(N-methyl-N-2"-phenylethylamino)-1,1-di(4'"-methylphenyl)-1-propanol 20b

Prepared from the corresponding amide in $35 \%$ yield; pale yellow foam; $[\alpha]_{\mathrm{D}}^{20}+37.6(c=1.20$, $\mathrm{CHCl}_{3}$ ); IR (KBr) 3420 (br), $1500,1450,1350 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.97$ (br s, $1 \mathrm{H}), 7.51-7.46(\mathrm{~m}, 5 \mathrm{H}), 7.35(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.22-7.11(\mathrm{~m}, 9 \mathrm{H}), 6.95(\mathrm{~s}, 1 \mathrm{H}), 6.86(\mathrm{~d}, J=6.9$ Hz, 2H), 4.06 (br s, 1H), 3.11 (d, $J=7.2 \mathrm{~Hz}, 2 \mathrm{H}$ ), 2.65-2.25 (m, 4H), 2.41 (s, 3H), 2.35 (s, 3H), 2.08 (s, 3H); ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 143.0,141.0,139.7,136.8,136.4,136.3,128.8,128.7$, $128.3,128.1,127.6,127.2,126.0,122.4,122.0,119.4,119.1,114.4,111.2,78.2,73.0,58.1,39.7$, 35.4, 23.5, 21.0; MS (+CI) m/z (relative intensity) $489\left(\mathrm{M}+\mathrm{H}^{+}, 42\right), 211$ (100); HRMS (+FAB) calcd for $\mathrm{C}_{34} \mathrm{H}_{37} \mathrm{~N}_{2} \mathrm{O}\left(\mathrm{M}+\mathrm{H}^{+}\right)$: 489.2906; found: 489.2972; anal. calcd for $\mathrm{C}_{34} \mathrm{H}_{36} \mathrm{~N}_{2} \mathrm{O}$ : C, 83.57; H, 7.43; N, 5.73; found: C, 83.40; H, 7.45; N, 5.51.
4.8.3. 3-(3'-Indolyl)-(2S)-(N-methyl-N-3"'-methylbutylamino)-1,1-di(4"'-methylphenyl)-1-propanol $20 c$

Prepared from the corresponding amide in $67 \%$ yield; pale yellow foam; $[\alpha]_{D}^{20}+40.0(c=1.03$, $\mathrm{CHCl}_{3}$ ); IR (KBr) 3380 (br), 1450, $1350 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.09$ (br s, 1 H ),

4.8.4. 3-(3'-Indolyl)-(2S)-(N-methyl-N-3", $3^{\prime \prime}$-dimethylbutylamino)-1,1-di(4"'-methylphenyl)-1propanol 20d

Prepared from the corresponding amide in $65 \%$ yield; pale yellow foam; $[\alpha]_{D}^{20}+48.4(c=1.39$, $\mathrm{CHCl}_{3}$ ); IR ( KBr ) 3310 (br), $1470,1370 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.08$ (br s, 1H), $7.57-7.50(\mathrm{~m}, 5 \mathrm{H}), 7.33(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.21-7.08(\mathrm{~m}, 6 \mathrm{H}), 6.96(\mathrm{~d}, J=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.60-6.05$ (br s, 1H), $4.08(\mathrm{dd}, J=10.5,3.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.21-3.06(\mathrm{~m}, 2 \mathrm{H}), 2.40(\mathrm{~s}, 3 \mathrm{H}), 2.37(\mathrm{~s}, 3 \mathrm{H}), 2.33-2.07$ $(\mathrm{m}, 2 \mathrm{H}), 2.04(\mathrm{~s}, 3 \mathrm{H}), 1.34-1.06(\mathrm{~m}, 2 \mathrm{H}), 0.69(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 143.2,141.3$, 136.7, 136.4, 136.1, 128.7, 128.2, 128.1, 127.6, 127.3, 122.4, 121.9, 119.2, 119.1, 114.4, 111.1, 77.6, $72.1,52.0,42.3,40.0,29.3,23.6,21.0 ; \mathrm{MS}(+\mathrm{CI}) \mathrm{m} / \mathrm{z}$ (relative intensity) $469\left(\mathrm{M}+\mathrm{H}^{+}, 8\right), 211(100)$; HRMS (+FAB) calcd for $\mathrm{C}_{32} \mathrm{H}_{41} \mathrm{~N}_{2} \mathrm{O}\left(\mathrm{M}+\mathrm{H}^{+}\right)$: 469.3219 ; found: 469.3242; anal. calcd for $\mathrm{C}_{32} \mathrm{H}_{40} \mathrm{~N}_{2} \mathrm{O}: \mathrm{C}, 82.01 ; \mathrm{H}, 8.60 ; \mathrm{N}, 5.98$; found: C, 81.82; H, 8.77; N, 5.77.

### 4.8.5. 1,1-Diethyl-3-( $3^{\prime}$-indolyl)-(2S)-(N-methyl- $\mathrm{N}-3^{\prime \prime}, 3^{\prime \prime}$-dimethylbutylamino)-1-propanol 21

Prepared from the corresponding amide in $71 \%$ yield; colorless solid; mp $122-123.5^{\circ} \mathrm{C}$ (EtOAc-hexane); $[\alpha]_{\mathrm{D}}^{20}-17.8\left(c=2.29, \mathrm{CHCl}_{3}\right)$; IR ( KBr ) 3240 (br), 1440, $1350 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.27$ and $8.15(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 7.65(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.37(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H})$, $7.26-7.11(\mathrm{~m}, 2 \mathrm{H}), 7.03(\mathrm{~d}, J=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.68(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 3.29(\mathrm{br} \mathrm{d}, J=10.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.13$ (dd, $J=15.0,10.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.86(\mathrm{dd}, J=15.0,3.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.55-2.28(\mathrm{~m}, 2 \mathrm{H}), 2.34(\mathrm{~s}, 3 \mathrm{H}), 1.90-1.78$ $(\mathrm{m}, 1 \mathrm{H}), 1.68-1.49(\mathrm{~m}, 2 \mathrm{H}), 1.47-1.14(\mathrm{~m}, 3 \mathrm{H}), 1.00(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}), 0.98(\mathrm{t}, J=7.5 \mathrm{~Hz}, 3 \mathrm{H})$, 0.74 (s, 9H); ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 136.4,127.3,122.4,121.9,119.2,118.8,114.7,111.2$, $73.8,67.4,42.6,29.5,29.3,28.8,28.1,21.4,8.0$; MS (+CI) $m / z$ (relative intensity) $345\left(\mathrm{M}+\mathrm{H}^{+}\right.$, 100); HRMS (+FAB) calcd for $\mathrm{C}_{22} \mathrm{H}_{37} \mathrm{~N}_{2} \mathrm{O}\left(\mathrm{M}+\mathrm{H}^{+}\right)$: 345.2906; found: 345.2906; anal. calcd for $\mathrm{C}_{22} \mathrm{H}_{36} \mathrm{~N}_{2} \mathrm{O}: \mathrm{C}, 76.69$; H, 10.53; N, 8.13; found: C, 76.63 ; H, 10.91; N, 8.08.

### 4.9. The chiral ligand-promoted addition of $E t_{2} \mathrm{Zn}$ to aldehydes; general procedure

To a solution of the chiral ligand $\mathbf{2 1}(0.18 \mathrm{mmol})$ in dry $\mathrm{PhMe}(8 \mathrm{~mL})$ under a nitrogen atmosphere cooled in an ice-water bath (ca. $0^{\circ} \mathrm{C}$ ) was added a solution of $\mathrm{Et}_{2} \mathrm{Zn}(4 \mathrm{~mL}, 1 \mathrm{M}$ in hexanes) via a syringe. After stirring for 10 min , freshly distilled benzaldehyde $(0.20 \mathrm{~mL}, 1.80 \mathrm{mmol})$ was added into the mixture via another syringe. The resultant mixture was allowed to warm up to room temperature and stirred for 96 h at the same temperature. The reaction mixture was cooled in an ice-water bath and quenched by $5 \% \mathrm{HCl}$ aqueous solution. The mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}$ $(3 \times 20 \mathrm{~mL})$, washed with brine, dried over anhydrous $\mathrm{MgSO}_{4}$, and condensed under reduced pressure. The residue was purified by flash column chromatography (silica gel, $10 \% \mathrm{EtOAc}$ in hexane) to give ( $R$ )-19 in $70 \%$ yield. For other chiral ligands, the reaction time, yield, and enantiomeric excess are summarized in Tables 1 and 2.

### 4.10. General conditions for HPLC analysis of chiral alcohols

Method A: Chiralcel OD column eluted with hexane:2-propanol (97.5:2.5) at $1.0 \mathrm{~mL} / \mathrm{min}$ using UV detector at 254 nm .

Method B: Chiralcel OD column eluted with hexane:2-propanol (96:4) at $0.5 \mathrm{~mL} / \mathrm{min}$ using UV detector at 254 nm .

Method C: Chiralcel OD column eluted with hexane:2-propanol (97:3) at $0.5 \mathrm{~mL} / \mathrm{min}$ using UV detector at 254 nm .

Method D: Chiralcel OD column eluted with hexane:2-propanol (85:15) at $0.5 \mathrm{~mL} / \mathrm{min}$ using UV detector at 254 nm .

Method E: Chiralcel OD column eluted with hexane:2-propanol (95:5) at $1.0 \mathrm{~mL} / \mathrm{min}$ using UV detector at 254 nm .

Method F: Chiralcel OD column eluted with hexane:2-propanol (90:10) at $0.5 \mathrm{~mL} / \mathrm{min}$ using UV detector at 254 nm .

Method G: two Chiralcel OD columns eluted with hexane:2-propanol (96:4) at $0.6 \mathrm{~mL} / \mathrm{min}$ using UV detector at 254 nm .

Method H: two Chiralpak AD columns eluted with hexane:2-propanol (99.6:0.4) at $1.0 \mathrm{~mL} /$ min using UV detector at 230 nm .

Method I: two Chiralpak AD columns eluted with hexane:2-propanol (98:2) at $1.0 \mathrm{~mL} / \mathrm{min}$ using UV detector at 230 nm .

Method J: Chiralcel OD column eluted with hexane:2-propanol (99.8:0.2) at $1.0 \mathrm{~mL} / \mathrm{min}$ using UV detector at 230 nm .

Method K: Chiralpak AD column eluted with hexane:2-propanol (98:2) at $1.0 \mathrm{~mL} / \mathrm{min}$ using UV detector at 230 nm .

### 4.11. Autocatalysis of (R)-1-(2'-furyl)-1-propanol (R)-22q

To a solution of the chiral alcohol $(R)-\mathbf{2 2 q}(82.0 \%$ ee, $19.2 \mathrm{mg}, 0.152 \mathrm{mmol})$ in dry $\mathrm{PhMe}(8$ mL ) under a nitrogen atmosphere cooled in an ice-water bath (ca. $0^{\circ} \mathrm{C}$ ) was added a solution of $\mathrm{Et}_{2} \mathrm{Zn}(4 \mathrm{~mL}, 1 \mathrm{M}$ in hexanes) via a syringe. After stirring for 10 min , 2-furaldehyde ( $165.5 \mu \mathrm{~L}$, 2.00 mmol ) was added into the mixture via another syringe. The resultant mixture was allowed to warm up to room temperature and stirred for 96 h at the same temperature. The reaction mixture was cooled in an ice-water bath and quenched by $5 \% \mathrm{HCl}$ aqueous solution. The mixture was extracted with ethyl ether ( $3 \times 20 \mathrm{~mL}$ ), washed with saturated aqueous $\mathrm{NaHCO}_{3}$ and brine, dried over anhydrous $\mathrm{MgSO}_{4}$, and condensed under reduced pressure. The residue was purified by flash column chromatography (silica gel, $\mathrm{MeOH}: E t O A c:$ hexane $=1: 10: 50$ ) to give $(R) \mathbf{- 2 2 q}(250.0 \mathrm{mg}$, $92 \%$ yield $):[\alpha]_{\mathrm{D}}^{20}+5.45\left(c=2.40, \mathrm{CHCl}_{3}\right) ; 27.6 \%$ ee by HPLC analysis of the corresponding benzoate using Method I. The ee of the newly formed product was calculated to be $23.1 \% \mathrm{ee} .{ }^{21}$

### 4.12. Autocatalysis of (R)-1-(2'-thienyl)-1-propanol (R)-22r

To a solution of the chiral alcohol $(R)-\mathbf{2 2 r}(94.9 \%$ ee, $22.4 \mathrm{mg}, 0.158 \mathrm{mmol})$ in dry $\mathrm{PhMe}(8$ mL ) under a nitrogen atmosphere cooled in an ice-water bath (ca. $0^{\circ} \mathrm{C}$ ) was added a solution of $\mathrm{Et}_{2} \mathrm{Zn}(4 \mathrm{~mL}, 1 \mathrm{M}$ in hexanes) via a syringe. After stirring for $10 \mathrm{~min}, 2$-thiophenecarboxaldehyde $(187 \mu \mathrm{~L}, 2.00 \mathrm{mmol})$ was added into the mixture via another syringe. The resultant mixture was allowed to warm up to room temperature and stirred for 96 h at the same temperature. The reaction mixture was cooled in an ice-water bath and quenched by $5 \% \mathrm{HCl}$ aqueous solution. The mixture was extracted with ethyl ether $(3 \times 20 \mathrm{~mL})$, washed with saturated aqueous $\mathrm{NaHCO}_{3}$ and brine, dried over anhydrous $\mathrm{MgSO}_{4}$, and condensed under reduced pressure. The residue was purified by flash column chromatography (silica gel, MeOH:EtOAc:hexane $=1: 10: 50$ ) to give 2-thiophenecarboxaldehyde ( $30.0 \mathrm{mg}, 13 \%$ recovery) and $(R)-\mathbf{2 2 r}\left(191.0 \mathrm{mg}, 68 \%\right.$ yield): $[\alpha]_{\mathrm{D}}^{20}$ $+3.51\left(c=2.56, \mathrm{CHCl}_{3}\right) ; 13.9 \%$ ee by HPLC analysis of the corresponding benzoate using Method I. The ee of the newly formed product was calculated to be $3.1 \% .^{21}$

[^1]:    ${ }^{a}$ Reaction was carried out in dry PhMe-hexanes (2:1) at $20^{\circ} \mathrm{C} .{ }^{b}$ Isolated yield of pure product. The $R$ configuration was assigned according to the sign of optical rotation. ${ }^{c}$ Determined by HPLC over a chiral column, see Experimental Section for analyzing conditions. ${ }^{d}$ Determined for the corresponding benzoate.
